Hillside, Illinois 60162

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

Keywords: scanner Re: Is there any inexpensive scanner which covers the 900 Mhz

band.

Yes, the Regency MX7000 covers 25-550 MHz and 800-1200 Mhz. It lists for around $400-$500. I have played with the MX5000, which I guess is the same scanner without the 800-1200 Mhz (looks the same and they have a common maintenance manual). I noticed two annoyances: The scan rate is slow (~5 channels per second), and you have to access individual channels by keying in the number on the front panel - there is no single button channel select. It has 20 channels.

By the way, the best place to find scanner ads at discount prices seems to be "Popular Communications." However, I suggest you ignore the articles unless you are prepared to sacrifice your technical knowledge and common sense.

P.S.

>>> W H O O P I E !!! <<<

I worked the Space Shuttle Challenger W0ORE today and received acknowledgement. Rig was 160W FM to 14el beam accurately pointed. Range at contact was 830 miles.

It is unlikely that the pre-amp will improve selectivity unless it is very "stiff". There is no reason to believe that the selectivity in a preamp will be any better than that in the receiver it is connected to.

I have a Mirage amp with pre-amp that I bought for contacting Challenger (successfully!), and I haven't noticed any intermod here in Phoenix with it. On the other hand, none of my rigs hear intermod here except the Bearcat 20/20 scanner.

There is no standard list in use nationwide. I have heard widely varying meanings for the same "10 codes". I suggest that you call the police department of interest and ask them. The Phoenix Police Department here has a citizen ride-along program. When you go on it, they give you a complete list of 10-codes and the other codes they use. Maybe they have a similar service in your area. By the way, a common way to select other codes (211, 459, etc) is to use the criminal code number for the offense being described.

In Phoenix, I have copied 5 orbits and worked him once. On all orbits he was
weaker than W5LFL was, with the strongest signal an S4 (??) on AZDEN 3000.
I have no SSTV equipment so have not looked at images, although they are
on tape and will be decoded at a friends QTH. Antenna system is KLM 14 el
vertically polarized beam with accurate AZ tracking and EL of 0 degrees.
The weak signals were heard on relatively close orbits that would have been
S9 on the W5LFL mission, so I wonder if his ERP is down for some reason.

Any idea where I can find a working or restoreable pair of Western Electric
Picturephones? I'm looking for the real thing, not a work-alike. They are
all phone company property, I know, but regular phones have leaked out, so
why not picturephones?

All suggestions, including pointers to a more suitable newsgroup (I posted
here because hams are so resourceful) are welcome.

I agree with KY2D's comments on roof mounted towers.
I have a roof mounted section of ROHN tower that has angle-iron feet.
I installed 2-by-10's under the roof between the rafters and bolted the
tower thru these boards. Standing on the tower and trying to rock it
shows no give at all. I weatherproofed the bolt holes with roof cement.
I don't have a tribander on it but I have 4 VHF/UHF ham and TV antennas
on it. This same tower section did support a TA-33 at one time and
survived 70 plus mph winds.

qst de k9eui
hr propagation forecast bulletin nr 31 from arrl headquarters
newington ct august 4, 1985
to all radio amateurs bt

areas of the sun responsible for the solar flux peak of 101 on
july 7 are facing the earth again, but currently the flux is
resting at 77. it peaked at 81 july 29 and 30, and has been
drifting slowly downward since. despite lower flux levels, the
28 and 50 mhz bands were open to europe in the evening of
august 4, eastern time.   several contacts were made with an
ea4, crossband 50 to 28 mhz. many contacts were made 2 way on
50 mhz with the british isles earlier last week.

reflecting the changing position of the sun with respect to the
northen hemisphere, there has been north south f layer
propagation, on 28 mhz in the past few days. ten meter beacons
in several south american countries, and as far south as vp8,
are being heard again for the first time since early june.   no
appreciable rise in east west f layer muf is likely for another
3 weeks or so.

only one small sunspot group has been visible recently, and
even that is shrinking in size. lower flux levels are not
necessarily bad for propagation, as nearly quiet sun (makes)
for generally more stable conditions on frequencies below 14
mhz at this time of year. we were in a disturbed period at
bulletin time, but better conditions are expected august 6 to 8
and 10 to 13. the second half of august will tend to be better
than the first. the solar flux average for july was 79. it is
expected to be somewhat lower in august, with a long low spell
after about the middle of the month ar

Some local FM radio stations broadcast stuff like stocks and commodities
on subcarriers. Get a CHEAP fm radio, and feed the audio output to a
PLL for FM subcarrier, or to the antenna of long Wave receiver for AM.
Some of them, like paging services, may use non-standard baud rates
that are related to multiples of the pilot (19000khz) for simplicity.
Even some TV stations are starting to put info on the audio subcarriers.
Since the FCC allowed stereo TV, they opened up a lot of extra space for
the TV broadcasters. This is NOT the same as the VIR stuff they hide,
like channel 9 from Atlanta. BTW, anyone know how the lawsuit over
who owned the VIR time between the Atlanta station and the satelite
people came out?

Have you checked with Bridge? I seem to recall some T1 products. If not,
they ought to be willing to whip one up for you as long as they retain the
rights to sell it elsewhere. The market ought to be quite large for this
kind of thing.

I be you'll find they already sell it, however.

Yeah, it was probably wishful thinking (to expect a Mirage preamp to cure
an intermod problem). Still, they MIGHT tune it up for just the 2-meter band,
whereas some of these walkies cover 140-170 or so and keep us in the ham band
only by grace of the synthesizer.

Here in the Boston area, some hams have solved a particular intermod problem
Telco repeater around 151 MHz) with a simple filter made out of a coax stub
and an inductor. I haven't tried it but the word is that it works quite well.
A construction article is available but you will have to beg and plead and
send an SASE for it.

Has anyone tried to mount a rig in a Ford van? I want to install a 2
mtr rig in a new van, but the logical place (radio location) has been
eliminated by XYL. There is essentally no way to mount it under the
dash near the driver withoug interfearing with driving, and the other
side of the engine cover is too far away to see or use when driving.

Bruce,

I have a roof mount for my Hygain Explorer 14 that I'm quite pleased with. My antenna mast is mounted on the back side of the roof a few feet from the peak. I built a "frame" for the mast mount out of 3 pressure treated 2X4s about 25" long that lie across the joyces and are bolted to the joyces with lag bolts. The 2X4s are parallel to each other and spaced about a foot apart. They are not quite parallel to the roof line and are caulked on their "uphill" sides so that they won't dam up rain water. The frame serves to distribute the load of the antenna across the joyces. I purchased 2 2' lengths of fireplace lentil at a

local brickyard. The lentil has an "L" shaped cross section. I drilled holes in the lentils and mounted them on the "frame" parallel to the fall line of the roof (that is, almost perpendicular to the 2X4s) and with the "feet" of the "L"s pointing outward. I spaced the lentils the mast diameter apart. I then drilled a hole through the mast about an inch above the bottom and corresponding holes in the lentils. The mast pivots on a 1/2" bolt through one lentil, the mast, and the second lentil. The antenna is held up by aircraft cable guys anchored to the roof with lag bolts. The mast is 12' high. I used roofing cement around all lag bolt holes and have had no problem with leaks. The antenna has been up 2 years this month, and I've had no problems whatever, but I do make a point of checking the installation twice a year since the failure of any one lag bolt will bring the system down. Except for the driven element, the system is a "plumbers delight" (just one big short), so I feel that the #4 copper ground wire from the mast gives pretty good lightning protection. Nevertheless, I keep the feedline disconnected from the rig and grounded when not in use as an added precaution.

I hope my experiences is of some help to you.

I am considering a set of phased verticles for my new QTH.
The basic idea is that they would stick out of the top of
trees which are about 20 meters high. I am interested in
40,30,20...10.

Any recommendations? How would you feed such antennas?
Half wave, center fed?

Anyone got any suggestions or report of experience?

I too would love to tinker with some Picturephones (tm), but alas, I think they are AT&T's best kept secret - perhaps to hide what was a rather bad marketing blunder. I understand that there are *large* quantities of unused Picturephones along with anciliary apparatus like Picturephone line repeaters, special KTU equipment, etc. which are still squirreled away by AT&T Technologies and the [former] Bell System operating companies.

Since the Picturephone was introduced ~1965, the electronic technology used in the apparatus is quite outdated by today's standards; the Bell System never sold enough systems to justify any newer design. If my data is correct, the Picturephone apparatus used *all* discrete components! As far as I have been able to observe, the Picturephone "Tele-conferencing Service" which is still offered by some of the [former] Bell System operating companies uses no apparatus in common with the original Picturephone station concept.

I would be interested in obtaining some Picturephones to play with if someone knows of a legitimate source.

I notice you specify sharp points on the umbrella leads. Isn't there a
controversy on sharp points vs balls on lightning arresters? I remember
reading that the conflict goes all the way back to Ben Franklin and the
King of England.

Most squelch circuits in FM receivers operate from detected noise, not AGC.
Most FM receivers do not even have AGC since limiting is necessary.
I do remember a few tube-type receivers that had some AGC applied to the
RF amplifier (like the Motorola "SENSICON").

Why try to eliminate the squelch tail anyway? It does serve as an audible
"over" signal. My only objection is to real long tails such as in a receiver
with a very loosely adjusted squelch.

qst de k9eui
hr propagation forecast bulletin nr 28 from arrl headquarters
newington, ct july 14, 1985
to all radio amateurs bt

since early last fall, sunspot numbers and the solar flux have
been close to minimum levels most of the time. february and
march solar flux averages were in the low 70s, with some days
as low as 69. in february the high was only 76. flux highs in
the 90s in april and may, and a peak of 101 this month, are
more in line with expectations for a period more than 2 years
from the likely end of cycle 21. solar observers found the sun
more interesting in early july than at any time in at least a
year, but the show now seems over for at least 2 weeks.

coming in late spring and early summer, this higher solar
activity was of little help to dx enthusiasts of the northern
hemisphere. we can only hope that the sun will do as well this
fall. until then, dx will be mostly in the lower latitudes and
on transequatorial paths, and on 14 mhz and lower frequencies.
sporadic e skip will keep 21, 24, 28 and 50 mhz active through
july regardless of solar activity.   except for e skip
influence, the propagation charts in july qst should be quite
accurate when the solar flux is above the middle 70s.

geomagnetic disturbances held at relatively high levels longer
than predicted last week.   with only minor flux variations
expected, the next 10 days or so should bring more stable
propagation on all dx frequencies.

american sunspot numbers for july 3 to 10 were between 32 and
83 with a mean of 60.1 ar

Does anyone has a list of bbs that are geared to ham radio.
I have found a couple in QST, but one of them is after hours
and the other is 300 Baud only (yech).

>The squelch tail occurs because the AGC gain opens up faster than the
>squelch closes. By using a longer time-constant ...

It doesn't quite work that way....

In most FM receivers, there is little or no AGC (if any, its just used
to prevent overloading of early stages). Instead, the signal is
amplified to levels that clip out all amplitude variations in the
signal. Since the modulation on the signal being received is in
the form of frequency deviations, the amplitude is irrelevent.

It is precisely because most natural noise the intrudes
upon a transmitted signal is amplitude in nature that this clipping
process (called 'limiting') eliminates the noise background on FM
signals. Since the modulation can still be recovered even after the
limiting has disposed of most of the amplitude variations, you have a
very quiet communications channel with little natural interference. It

even gets rid of a lot of electron noise generated in the receiver circuits. The receiver hears a lot of this noise from random electrons when there is no signal being received.

The squelch circuit in most receivers works by measuring the amount of high-frequency audio content in the received signal (typically, for a 300-3000 Hz communications channel, the squelch will sample at above 16 KHz). When this noise energy drops (when the receiver is quieted by a received signal), the squelch opens. Some more sophisticated receivers and in the received signal strength to prevent the squelch from blowing if the receive loses gain for some reason (lower supply voltage, for example, will reduce the gain and thus the noise, but won't simulate a received signal).

All such noise squelches have a slight delay before opening to eliminate popping cause by noise impulses that might momentarily quiet the receiver.

Some delay in closing the squelch is a good idea, as when a signal fades quickly due to reinforcement and cancellation of multiple reflections from the moving mobile transmitter or receiver (called ``chopping'' or ``popcorn'' depending upon its severity), the squelch should not close as it cannot open quickly enough to avoid cutting off small parts of the received audio. But on a strong signal that is not choppy, there is no need for a closing delay.

One of the first radios on the market with dual-rate noise squelch was the Motorola MICOR, which had a moderate delay when the signal's average quieting level was below some specific threshold, and was much faster when the signal was strong. The effect was that weak signals had a squelch tail but did not chop off voices, and strong ones went away without a noise burst.

Hope this clears up some of the confusion.

Keywords: Scanners
Summary: Looking for info on scanners capable of computer control

There are many scanners in the world with all sorts of neat features.
Unfortunately, they never seem to do quite what you want. For example,
when searching a frequency range for new signals, there is no way to
skip specific frequencies which you don't want to hear.

I am looking for information on scanners which can be interfaced to
a computer so that the computer can exercise real-time control over
the parameters of the radio - especially frequency. I know of two
scanners with computer control (one made by Bearcat, and the other
a clone of the Regency MX-5000 made by AOR). Unfortunately, it is
pretty difficult to get information on either one. The last time I
talked to Bearcat (a while ago), they were unwilling to part with the
interface specs. Rather, they wanted one to buy a software package for
the computer of interest and just run it. I was unable to determine for
sure if the frequency skipping option is possible, but it looks like it
may not be. The computer may just be capable of loading the frequency
registers and reading usage counts, etc. If anyone knows more about this,
I would like to hear from them.

The AOR scanner is even more mysterious. It appears to be a Regency MX-5000
except with a Japanese name. There is an RS232 adapter for it for around
$130. However, finding out what you can do with that is an interesting
problem. My brother, who lives in Tokyo, is trying to find out but he
is not likely to succeed. Again, help!!

Does anyone know of any other computer controlled scanners? Regency? JIL?
etc...

As several people have pointed out, I blew it talking about AGC and
FM radio squelch tails. I WAS thinking about AM or SSB. (*blush*)

How DOES an FM squelch work??? (I admit it, I have no idea...)

I wouldn't let the RAM/backup design deter one from
buying a new ICOM R71A, as I think most people that buy
one new will be swapping it for a later model before
the
lithium battery runs down. The FRG8800 problem, on the
other hand, sounds like one that will affect owners of
new and used FRG8800 receivers alike.

TV Antennas as Scanner Antennas:
Textbook Answer

1. Because the lowest TV channel is around 56 MHz, a TV antenna doesn't excel in the 30 - 40 MHz range.

2. Because most stations one would monitor on a scanner use vertically polarized antennas, loss due to cross polarization would be experienced if using a horizontal antenna with a scanner.

TV Antennas as Scanner Antennas:
Experimenter's Answer

1. If you already have a TV antenna installed, try it on the scanner. Although I think you'll do better with a scanner antenna, my philosophy on receiving antennas is: if you can hear what you want to hear, USE it! I use coat hangers soldered into banana plugs on the back of 3 of my scanners.

2. The difference between using a 75 or 50 ohm antenna systems for a scanner receiving antenna is insignificant. The input impedance at the antenna terminals of a multi-band scanner is not a constant 50 ohms over the entire frequency range, and 75 ohms is close enough.

3. Remember that there are situations in which one doesn't want a "good" antenna. I monitor a local fire department frequency shared by dozens of towns, but I'm only interested in my own. For this purpose, I use the built-in telescoping antenna, collapsed down a few sections.

The majority of scanner purchasers aren't hobbyists, and are content with the telescoping antenna furnished with the radio.

Most hobbyists use the "ground plane" type of antenna with a coil in the vertical element for multiband reception. These antennas are made by Antenna Specialists and

Radio Shack, among others. The trap is designed to allow reception on 2 or 3 of the conventional bands. Avanti's 801 scanner antenna looks weird, but it too is designed for reception within discrete frequency ranges.

A new trend in monitoring is the availability of continuous coverage, wide band receivers. Now that reception of the 72-76, 200-400, and 800-1300 MHz bands is practical, one may consider using a set of antennas, each optimized for a particular band, or a single, broad band antenna. Hustler makes a broad band discone antenna for scanner use that sells for about $30.

This brings me to another subject. My Hustler discone wouldn't fit on the porch of my apartment, so I'm buying a multi-acre farmette. I won't keep cows in my barn (aka/inlaw suite), nor grow corn, but rather will plant an antenna crop.

Netnews submissions and listening activities will, of necessity, be limited during this busy time.

--

As someone correctly pointed out, the mic hanger in a mobile unit had a switch in it so when the mic was hung up the rcvr would revert to tone squelch. When the mic was removed, the set went to carrier squelch, which fulfilled the requirement to listen before transmitting. I was

thinking more of base stations being the violators of this rule than mobiles. Some of the Motorola base stations had a dual paddle mic. One paddle was the PTT and the other was the carrier squelch switch which, I observed, was seldom used by the operator. We had 2 towns here 8 miles apart, whose police dept's were on the same freq. I don't think either dispatcher ever listened before transmitting. One finally went UHF and the other ended up adding a input to make their station into a repeater. This was after several years of a "power war" between them.

I for one think it is fairly reasonable for a lithium battery to have a 7-year life span.

Just so it doesn't take a whole transceiver or receiver with it when it dies.

I do NOT think it is reasonable to have a designed-in "service call" at 7 years (plus or minus 5 or so), especially when it is UNreasonable to expect anyone other than the manufacturer to be able to perform the necessary service successfully.

Under the circumstances, it's more like a renewal of your license to use the radio, at whatever price the manufacturer feels like charging you at the time.

In summary, I might well elect to lease or rent an ICOM radio with this kind of design, but I will never BUY one.

Especially a 7-year-old used one!!!

One of the things I (used to) like about ham radio was that most hams
were pretty careful not to use coarse language on the air, in part because
the FCC was pretty adamant about this issue.

I have noticed a sudden rash of "off-color" words on the net in recent days.
I for one would like to see us all be a little more careful on this point.
What is perhaps acceptable in casual conversation comes off sounding pretty
coarse in print, even electron-excited phosphorescent print.

When coarse language is really intended, maybe something like #@$%&!!! will
convey the meaning.

I hope there is enough agreement on this subject that this comment will not
be considered out of place.

Is it legal to use ham gear which is not type-accepted for other uses
in ski patrol service? I am sure it would not be legal for commercial
applications.

Hams of course are free even to build their own equipment, so what's a little
modification if it is for ham use!?

qst de k9eui
hr propagation forecast bulletin nr 29 from arrl headquarters
newington, ct july 21, 1985
to all radio amateurs bt

the solar flux curve is following a trend that began in may. early in the month there was a marked rise, followed by a sharper decline to very near quiet sun values. in the low period that began july 15, the flux curve is almost exactly superimposed on that for 4 weeks earlier. this trend is expected to hold, with flux values close to 70 until about july 27th, followed by a steep rise in early august.

about half of the sun has been active and the other half almost quiet for the past 3 months. the active periods bring very frequent geomagnetic disturbances and unstable propagation. the calm, like the period now at hand, gives more stable conditions, but with lower muf. this should be with us through the rest of july, with more variable propagation again in early august. sporadic e layer ionization is now declining, so 21, 24, 28 and 50 mhz will be less active through the rest of the summer. a more direct relationship between solar flux levels and dx conditions will be apparent as we move into august, and increasingly clear in early fall. usefulness of the qst propagation charts will improve, especially where high latitude paths are involved.

there is some possibility of better hf dx conditions in late 1985 than were experienced in the same months of 1984. that was a time of exceptionally low solar activity for less than 9 years into cycle 21.

american sunspot numbers for july 11 to 17 were between 3 and 50 with a mean of 18 ar

75 to 50 ohm mismatch at the scanner is a 1.5:1 SWR, not much to worry about. And some of the 75 ohm aluminum shiellded cable is VERY LOW loss for the price. As for the TV antenna, it's probably designed to mount horizontally, with a mast up the center. Trying to mount it vertically may be a problem both mechanically and electrically, as a mast in line with the elements will probably affect it a lot. Don't get me wrong, I've used "other" antennas for lots of stuff like scanners and even transmitting. I'm now using an old Radio Shack VHF high band only base monitor antenna for a 2 meter transmitter. Believe it or not, I had to CUT the length down to make it tune. I get EXCELLENT results. (This is the old antenna that was discontinued in 1977 that has a base loaded coil. They sold a base version and a mobile version that were nearly identical. There was a taxi company near me that used the mobile version for their taxis, seems $16.95 was a lot cheaper than the Motorola antenna.)

On scanners, almost anything will work. Just get the antenna OUTSIDE and get it as HIGH in the air as you can.

Because it can be quite harsh, especially with repeaters like the old
07/67 in Baltimore that had no input receivers at the transmitter site.
When carrier was dropped, you would hear both the input receiver, the
link receiver, and your own radio's squelch tail.

My husband is selling off much of his current ham gear in preparation
for buying some new equipment. Any interested parties can reach him
through me - Mary Couse - at my work number (415) 494-4668 (Palo Alto
CA).
He has the following items for sale:

               >>> DRAKE TR7A <<<

     * 0 to 30 Mhz receive
     * 160 to 10 meters plus WARC bands transmit
     * 250 watts input to fan cooled solid state finals

Complete with:
  * fan for final stage   * MS7 speaker
  * noise blanker   * MN2700 2KW matching network
  * 250 Hz filter   * Operators' manuals
  * 500 Hz filter   * Service manual for the TR7
  * 1500 Hz filter   * Service extender boards
  * PS7 power supply with fan   * Original boxes
  * RV75 synthesized PTO

Mint Condition.....asking $1200.00

>>> DRAKE C LINE <<<

R4C receiver with: Noise blanker   28.0 Mhz crystal
              500 Hz filter 29.0 Mhz crystal
              1500 Hz filter MS4 speaker
              10 Mhz crystal

T4XC xmtr with: AC4 supply
              28.0 Mhz crystal
              29.0 Mhz crystal

Complete with cables, manuals and original boxes.....asking $450

>>> DRAKE CC-1 VHF CONVERTER CONSOLE <<<

Complete with power supply, crystal calibration, Drake 2 meter and 6
meter converters. Matches C-line equipment style.....asking $125

>>> MFJ VERSA TUNER II (MFJ-949) <<<

300 watt tuner with built-in dummy load, balun, antenna selector switch
(2 coax, 1 balanced wire).....asking
$75

>>> HEATH MONITOR SCOPE HO-10 <<<

Built-in two-tone oscillator.....asking $55

Here's a reposting of a past article on a computer controlled scanner product. A friend has one, and I saw a demo by the inventor at our scanner club meeting. After seeing the demo, I suggested a few new features, such as a producing a histogram in the search mode, which are now incorporated into the latest version.

Comquest SXP-210 Scanner Expansion Package

There was a demonstration at the Wheaton Hamfest of a new $110 software package that allows a Commodore 64 personal computer to control a Bearcat 210XL scanner. The SXP-210 comes with software on a 5.25" floppy diskette and a special interface cable, which connects the 64 to a ribbon cable within the 210XL.

Uniden's hasty withdrawl of the Bearcat CompuScan 2100 leaves the SXP-210 as the only product that will allow a personal computer to control a VHF/UHF scanner.

Some of the more interesting features listed in the sales litera-
ture:

- Expands [stock] 18 channels to 50.

- Removes the software constraints [of the stock 210XL] that prevented operation on the 6m and 10m amateur bands.

- Color graphics that identify type of radio service being monitored. (Police, Fire, Amateur, etc.)

- With a printer you can generate a chronological log of selected channels as they become active along with the time of day that the transmissions were received.

- Includes 12 hour time of day clock w/AM and PM designations.

- Adds a "count" feature to the 210XL, similar to the one on more expensive scanners.

- Edit mode allows flexible control of all channel info.

- Includes an improved search mode with a "Hold" [?] trigger feature.

- Channel lockout/selective scan delay.

- Includes a special list function that displays freq info for all 50 channels simultaneously on one screen.

Installation appears simple. A pliers is used to crimp a supplied socket onto an existing ribbon cable within the 210XL. An umbilical cable plugs into this socket and into the computer.

One drawback of the this 64/BC210XL setup is the scan rate rate of only 8 channels/sec, about half the scan rate of a normal 210XL.

For more info, contact:

Does someone out there know what the antenna setup is for the anateur radio operations on the space shuttle? Do the hams on board disconnect some mission radio equipment from external antennae and connect their ham gear during the scheduled times of operation? Or are there extra antennae installed, either mission spares or specially-set-up for the amateur radio operations, that are used? Or are no external antennae needed? (That is, is the shuttle made of enough composite and/or non-metallic components that it is not a "Faraday cage" that would restrict the RF radiation from passing through?)

I looked at at least one ham-radio magazine article on the subject, but found no technical details like this, which surprised me. Have there been QST or CQ articles covering ham radio on the shuttle with a lot of technical details? (Those are the only two ham mags that I can get to back issues of...)

Thanks for any info!

Regards,

I understand that the current ham antenna situation is the same as during Owen Garriot's flight. That is the ham-in-space puts an antenna up against a window when operation is to take place. It seems inconceivable to disconnect any "real" equipment during flight, and the cost of getting another hole in the shuttle whould be stupendous, as would be the delay.

x
     According to 1984 FCC records, the   Mt. Hood Ski Patrol,
     Inc. has these stations licensed for Special Emergency
     use in the   Public Safety radio service:

Mt. Hood Ski Patrol, Inc
[Government Camp, O]_ 155.2050____KON213
(govt recds)
" [Government Camp, O]_ 155.2050____KON215
(govt recds)
" [Parkdale, OR]_______ 155.2050____KON216
(govt recds)

Transmitting equipment used on these frequencies must be type accepted for this class of service. Thus, the Kenwood TR2500 could not legally be used for transmission on these frequencies.

The FCC may be more flexible in emergency situations, e.g., those in which life or property is in danger.

> Is it legal to use ham gear which is not type-accepted for other uses
> in ski patrol service? I am sure it would not be legal for commercial
> applications.
>
> Hams of course are free even to build their own equipment, so what's a little
> modification if it is for ham use!?

Blushing is definitely not necessary on the net. You are EXPECTED to make innacurate statements from time to time to keep us on our toes. If it happens naturally (as it does with most of us) then that just makes it less

work to think them up.

Most FM squelch circuits work by exploiting the difference in spectral density of noise coming out of the discriminator (or equivalent demodulator) on quiet or modulated carriers versus noise resulting from Gaussian noise alone in the IF strip. The most common form in my (casual) experience is a high-pass or bandpass filter off the discriminator output, followed by some kind of amplitude detector such as a rectifier and lowpass filter, and of course a threshold device such as a Schmitt trigger. The filter has to reject the speech band, and should pick up just above it and then drop off again after a couple of octaves.

It is surprising how sensitive the things can be to even a slight carrier as opposed to pure noise. Apparently the high-frequency noise just above the speech band, say 5 to 20 KHz, quiets very quickly when a weak carrier pops up. This is probably due to the sudden disappearance of the "clicks" that occur in FM when the IF signal-space phasor wraps around the origin. It does this all the time when the noise is pure Gaussian with approximately equal power in any two quadrature phases. When you "bias" it toward a particular sinusoidal phase, it suddenly becomes much harder to get it to wrap around the origin. It has to overcome the rapidly-diminishing Gaussian probability distribution to get over to the origin.

To understand the "clicks", you have to understand that an idealized FM demodulator (discriminator) looks at an IF wave and "computes" as its output the time derivative of the instantaneous phase of the narrowband random process it sees at its input. The phase is the arctangent of the ratio of the instanteous in-phase and quadrature-phase signals at any given instant. What is going on is that really rapid phase changes (which give large spikey outputs with lots of high frequency components because, remember, the phase is differentiated) tend to occur most easily when the amplitude in BOTH in-phase and quadrature phase channels happens to be small at the same time, i.e. the point in the plane representing the input random process is very close to the origin. When a signal is injected, this ensures that this "phasor" stays away from the origin and does not get to generate the rapid phase changes that occur without a signal, and especially not the really nasty ones that encircle the origin.

The squelch detector should not be too sensitive to much higher frequencies than necessary, because these are slower to quiet than lower frequencies. The phase differentiation process leads to a nearly flat spectrum for low signal amplitudes and a triangular one, i.e. one that rises linearly with frequency, for large SNR. The best place to sense the noise is just above the speech band, i.e. at as low a frequency as possible consistent with not being fooled by the signal modulation.

Does anyone have any idea how much a telephone company "leased-line" costs? Is it so much per mile? (A leased line is a pair of wires from one point such as a business or residance to another site such as a repeater site or another building). These are usually used with buglar alarm systems and commercial broadcast radio "remotes" and I believe consist of nothing more than a pair of wires from one site, to the phone company central office , then to the other site with no switching or electronic intervention in between. (Does anybody have any ideas how many junctions the installer of such a line has to make? I figure a minimun of three. One at the pole at one end, one that he must call into a central ofiice to have someone make between two big fat trunk cables, and then another at the pole at the other end). I believe you can put a battery of, say, 10V at one site and measure the battery voltage at the other, minus the voltage drop due to connections and distance. By the way, does anyone know?: a) the maximum allowed voltage on a leased line b) how many volts/mile is usually lost, and c) maximum allowable current (do they fuse it somewhere?).

I called the phone company and got the royal run-around. I tried to explain what I wanted but was told of auto-ring circuits like the taxi phones use (how much do they charge for those/month). As soon as I mentioned that it would be for ham-radio remote control and also possibly

burglar alarm monitoring, I was referred to the "mobile-phone" group which deal with mobile phone companies (probably that cellular garbage) and they told me their lines cost $24.50/month and then an additional fee for each minute of "air-time". I then tried calling back the original office and re-explained that it would be like a burglar alarm line, was then asked if it was for voice, I was puzzled and said no, and was then told that burglar alarm lines run ONLY to the police station and could not go between residences.(when she asked me if it would be used for voice, it made me wonder if they sell different kinds of lines , like, voice-quality, and not voice-quality?? What good is a non-voice quality line anyway????)
I then tried to explain that all I wanted was a pair of wires from point A to point B but then she asked, " what kind of jack do you need, an RJ-11C?" As you can see, I could not get past the non-technical salespeople. What is the OFFICIAL name for this kind of line?
If there are any phone company gurus out there, H E L P!

Thank you for any and all answers.

Actually the story I know is that at least one police chief used to listen to the dispatch channel for the squelch tails. The radios used in the cars used a reverse burst so there was no squelch tail while the HT-220's had no reverse burst and a squelch tail. This way he could tell who was possibly taking a break at an eatery and who was in the car.

He was rather mad when he got his brand new Micor radio for his base station which did not have a discernable squelch tail on strong signals.

  Does anyone have any info on if there is an inexpensive receiver on
 the market yet for 900 mhz ? I have a bearcat 210xl and it stops abt
 512 mhz. Perhaps a converter? I have an mfj converter for my handie for
 154 ish to abt 164 and it works ok. It seems to be a growing trend here
 on the east coast toward 900 , several police dept's have gone,now my
 local town, cellular, and amateur, sure would like to listen to the
 activity there.
                                      tnx in advance...

I had a TA33 Jr on my roof for a year then replaced it with the full TA33 about 2 years ago. It is on a 10 foot tripod and I am using alight duty TV type rotor. It is not guyed and has survived several NJ winters.

My only tip is to use threaded rod to bolt it to the roof, not wood screws. Use long rods and place a long 2x8 (or 2x10) under the rafters to spread the stress across several rafters.

Good luck. 73, Jim KY2D

Bruce--I have a pseudo-roof mounted beam, and I went thru the
same drill and quandries about what to do. What I elected to do,
somewhat due to simplicity, somewhat due to geometry, was to use
a 30' telescoping TV mast alongside the house. The mast is
drilled thru the eaves of the house, thus allowing it to be well
secured at that point as well as easy to pull up while standing on
the roof. It's easy to mount the antenna, too, because all work can
be done at eye level on the roof vice on ladders.

If you opt for an actual roof mount, I suggest a triangular tower
section with a tilt-over base, again for the sake of mounting the
antenna and raising it. You WILL need to bolt the tower section
THRU your roof, which can be a problem for some houses (like ours

which has open beam ceilings thruout!). And you will need to guy
it well since you don't want the antenna to take your roof off in
a good wind! And remember about using non-resonant lengths of guy
wires.

I have a TH-3JRS which is no big shakes as a beam, but it beats the
heck out of dipoles and verticals! I wouldn't advise roof-mounting
an antenna too much bigger than that--the wind load is really
incredible, even on the smaller beams.

Hope that helps. 73--

They were probably wondering if you wanted voice quality or data quality.
Data quality lines are less noisy than voice quality. It sounds like you
want a data-quality leased line.

Some comments:

1. Be very careful climbing around on your roof. And on ladders on the way up and down, too. Also, be extremely careful to avoid having ladders or antennas (or YOU) come in contact with power lines which may enter the house somewhere near where you are working, or which may pass by your house near roof level.

2. One DISADVANTAGE of a roof-mounted antenna is that it might possibly attract a lightning strike to your house. A lightning arrester on the house might be a good idea. (This might be a good line of argument to get the XYL to reconsider the tower issue!) (Or maybe to reconsider her choice of OM.) NOTE: A VERY effective lightning arrester can be made by taking a length of very finely stranded welding cable and stripping it back 6 inches or so and "fraying" the end of the wire into a bushy "head of hair" made up of the individual tiny strands of wire. This is mounted with the "hair" pointing upwards, up high on your tower, above the beam if possible, and grounded to the tower or else the heavy cable is itself run down the tower and to a good ground system -- preferably several independent ground rods tied together. Keep the grounding cable straight insofar as possible, as curves become inductive and encourage lightning bolts to jump off for something nearby that they like better.

According to Don Clark, a transient protection consultant used extensively by FEMA (the Federal Emergency Management Agency), installations protected with this "head of hair" approach simply NEVER have lightning strikes. The fine points of the wire cause such an intense electric field that the air around them breaks down and leaks off the charge in little sparks rather than one big one! According to Don, you should give the gadget a "haircut" about once a year, because little spherical beads of copper form at the ends of the fine strands, indicating that they are carrying heavy currents at times. Eventually this will decrease the E-field intensity at the ends and reduce the protection the device gives. Snipping off the little beads will restore its performance. Eventually you will of course have to use another piece of welding cable to replace the used-up end.

3. If you are still not cowering in fear, you might find W6SAI's book
The Antenna Handbook a useful source of ideas on roof mounting. The ARRL
Antenna Handbook also has some wisdom in it. Basically, there are
little bitty sections of tower that are designed to go on a rooftop.
It is also possible to use TV mast for small beams. Guy wires are a good
idea in either case.

4. Be careful what you attach to or guy to -- in a severe windstorm, it is
possible for a large, roof-mounted antenna to be stronger than the things
it is attached to and to pull off sections of roof or chimney or whatever.
(Another argument for your XYL!)

5. You might look into Dick Austin's itty-bitty little triband beam, which is
small and light enough to install very reasonably on a TV mast. I believe it
uses twin-lead to feed it and requires a tuner and a balun, but it is possible
to run a short length of coax and put the balun outside the house if you have
problems running twin lead in and out. This unit has about 4 to 5 dB of gain
over a dipole, and like all Austin antennas, this is what you would actually
measure on an antenna range. The better small tribanders run 7 or 8 dB if
you are lucky, i.e. about a half S-unit better. If you are lucky.
Austin is in Sandown, NH. His mailing address is PO Box 357, ZIP is 03873.
His phone is (603) 887-2926.

Dick will probably also be willing to give you good information on which
competitors' antennas are reasonably good if you choose to pick one which is
coax-fed. He tends to be very helpful and objective when it comes to
discussions of antennas, although he of course would be happy to sell you one.

That's AT LEAST all I know, maybe a lot more!

73,
John S., W3IKG

The name you'll want to use when dealing with the telco is
"Local Area Data Channel", or "Local Area Data Service". We
usually just call them LADS lines. You will probably want to
get a publication from the telco called "Data Communications
using Local Area Data Channels". Its number is PUB 41028, dated
June 1979. This used to be called a "Bell System Technical Reference",
but is probably something else since the divestiture.   All of the
technical questions you raised are answered in this publication.
If you want end-to-end DC continuity, you must ask for it specifically.
As for cost, the ones we have that connect buildings on campus cost
$38 per month per pair ($76/month for a 4-wire DC line). Using
Bo-Sherrell M1 short-haul modems (actually differential DC line
drivers), we can get no more than 2400 baud on them.

I hope this helps.

     ---Bob.

The following list of questions was printed in MONITORING TIMES, July '85, page 19. The first person to send correct answers to *all* these queries (to the mailing address given below) will get a free book from those published by Grove. However, I think this is the ideal sort of thing to be discussed on the net, so I thought it might be interesting to throw these out to inspire discussion, debate, and infuriated flamage...

Why were phonograph turntable speeds set at 33 1/3rd, 45, and 78 RPM?

Why were tape recorder speeds set at 3 3/4ths, 7 1/2, and 15 IPS?

Why was motion picture film width set at 8, 16, and 35 mm?

Why are the standard worldwide AC line-voltage frequencies 50 or 60 Hz?

Why is line voltage typically 120 or 240 Volts?

Why are standard US (NTSC) tv pictures composed of 525 lines?

Why was 500 kHz chosen as the worldwide marine distress frequency?

Why were 50, 72, and 300 ohms selected as standard antenna matching impedances?

Why is the commercial motion picture frame rate 24 per second?

*** End of question list ***

If you want to try to win the book, you can send your answers to:

Monitoring Times
Grove Enterprises
PO Box 98
Brasstown, NC 28902

Myself, I have *no idea* as to the answers to most of these "why?"s --
I think I recall reading the answers to some of them in the past, but
cannot recall just where...

Happy debate! Will

edom of speech is a wonderful freedom. i wish i saw more on
the air. or should i say 'hear' more on the air!

i'd like to know if their are any political discussion nets on the air.
i like to hear other peoples views on current events around the nation.
i'd like to hear the pros and cons on meaningful topics.

can someone provide a frequency and time if such a net exist?

it's not that i think i am smarter than everyone and want to
show it. i'd just like to exchange ideas and grow a little.

i'd like to know what the canadians think of us down here.

have you heard of such a net?

> Does anyone have any idea how much a telephone company "leased-line"
> costs? Is it so much per mile? ...

Having battled with Ma Bell (or what *used* to be Ma Bell) for a number of years on leased lines for process control and telemetering purposes, I'll try to give you a brief summary of what you can and cannot do.

First of all, there may be some variations of what I have to say, depending upon the tariffs of your local telephone company. What I am saying is correct for NY Telephone, however.

Charges are based upon where the two leased line termination points fall with respect to telco-defined central office boundaries. There boundaries generally bear little resemblence to city/town/village/county boundaries. If the two points fall within the same central office district, then the charges consist of central office loop charges - one for point A to the CO, and one for point B to the CO. In addition, there are local wiring and jack charges for each end. The average charge for a leased line having both points within the same central office in upstate New York is around $ 35.00/month, with an installation charge of around $ 300.00. Don't forget - this charge could well be different in your area.

If the two points are in different CO's, you will pay the airline mileage between the two CO's in addition to the central office loop and local wiring/jack charges If the two termination points are only 1,000 feet apart but in different CO districts, you will *still* pay the airline mileage! This is referred to interexchange mileage (IXC). In upstate New York this is around $ 24.00 per mile per month for an IXC of less than 12 miles. The rate decreases for over 12 miles.

Let's assume your leased line is in the same CO district. What do you get for your 35 bucks a month? You get a pair of wires have a DC loop resistance of no more than 1,000 ohms and an attenuation at 1 kHz of no more than 5.5 dB. If your total *loop* distance is greater than 2 miles you will most likely have a pair with loading on it, which will automatically limit your high frequency response to 3 kHz. You should not assume an upper frequency response of greater than 3 kHz anyhow. In general, you cannot apply tone signalling to the leased pair in excess of 0 dBm. You cannot exceed 135 volts from either conductor to ground, or 270 volts from conductor to conductor. You cannot exceed 150 milliamperes in loop current. Any circuit which you connect to the leased line must be longitudinally balanced. You can request a line impedance of 600 or 900 ohms; whether the circuit is actually engineered for the requested impedance is another matter.

If there is significant distance between the two terminal points, the telco may provide (as part of the expense) a repeater amplifier so that they will meet the 5.5 dB transmission requirement. This repeater will be of either a negative-impedance E-type, or of a hybrid V-type. If there is a repeater provided, you MUST maintain your requested 600 or 900 ohm impedance at BOTH ends or the circuit may `sing`; this is your responsibility, and not the telco's. Either of the above repeaters will pass DC signalling and will of course provide the same gain in both directions. Unbalanced DC currents may also saturate the transformers in the repeaters and cause them to sing.

In general, your equipment should work on a 1,000 ohm loop. While you can request a lower loop resistance, you might have to pay extra for it, or it simply may be unavailable for the particular circuit.

If your circuit runs between two central offices, you cannot get DC continuity from the telco, and you will have to use tone signalling, all of which will have to be inband (300 to 3,000 Hz). There is a type of DC signalling called E&M signalling which is availavle at extra cost. In simple terms, E&M signalling will give you a contact closure in each direction at

a rate not to exceed 20 Hz. The telco installs additional equipment to facilitate the E&M signalling function - which is *their* responsibility. You must be able to source a current-limited -48 volts DC in order to interface with the E&M signalling equipment.

If your IXC is greater than 12 miles, you are entitled to get a four-wire termination if you so choose at no extra cost. Four-wire circuits for less than 12 miles IXC cost twice as much as a two-wire circuit.

To order your circuit you should request a "Radio Tie Line" to make things simple for the usual idiots at the business office. They will no doubt refer you to a specialized salesperson who handles leased-lines, who will send you an engineering form to fill out where you describe your terminal equipment and your desired circuit specifications. You will also have to certify on this form that you will not exceed any pre-defined circuit limits (like voltage, current, etc). The limits really *DO* have to be adhered to so as not to cause interference to other services in the same cable, or cause harm to the network or telco craftspersons.

Chances are you will find the cost of *any* leased-line prohibitive for amateur radio use, but I thought I would at least take some mystery out of the world of leased-lines.

I am looking for a new way to spend money and need some advice.
(The XYL is not available on technical matters.) I want to upgrade my
2m mobile capabilities from the present Kenwood TR2400 handheld to a
real mobile transceiver, and am shocked at the bewildering array of
choices. Any advice, comments, biases, prejudices, you have to offer
would be gladly accepted.

Regards,

Jim WA5OYF

Re: ways to spend money: Send some of it out here and I'll take care of the problem for you.

Re: 2m transceivers: From what I have heard, the Kenwood 7950 is about as nice a rig as is currently available. I know a number of owners, and I have heard NOT ONE WORD of complaint, only praise for the unit.

Another possibility is to buy an amplifier for the HT. That's especially useful if you travel a lot and want a little more "oomph" than an HT gives when on a trip. I have been very happy with the DAIWA 30-watt amplifier. Mirage makes a couple of nice ones too.

Eh, live it up and buy one of each. After all, it's only money!

-John S., W3IKG

Incidentally, has anyone had experience with the effect of the Mirage amplifiers with RECEIVE PREAMPS on INTERMOD performance? I theorize that a good receive preamp with some selectivity in the front end could actually improve intermod immunity. If so, this would be the type of amplifier to buy for your HT.

The "What is your favorite rig" question can produce flaming, wise cracks
and other net traffic but my reply comes from my good experience. For the
price I have been very impressed with my ICOM 25AH-2W/45W output. With
my 5/8 Larson and 45W I can hit all sorts of places. The 27AH which is what
is available now seems even better. It has built in PL, I had to add PL to
my externally so that I could make it switchable. I am not sure if the 27AH
has any trouble with the recently flamed about disappearing-memory-after-5-yrs
trouble. Anyways, I'll give you a vote for 45W in a small package for the
25AH/27AH.

qst de k9eui
hr arrl bulletin nr 59 from arrl headquarters
newington ct july 27, 1985
to all radio amateurs bt

what follows is a summary of the major actions taken at the 1985 second meeting of the board of directors of the arrl, which was held in hartford, ct on july 25 and 26.

with regard to the repeater coordination proposal in fcc docket 85 22, the board directed counsel to file in support of preferred status for coordinated repeaters, that frequency coordination be urged but not mandated, that coordination be on a local or regional level, and that coordination include auxiliary operation. consistent with this action the board ordered that a study be made of the costs of maintaining a national repeater data base.

the board went on record in favor of fcc retaining responsibility for all amateur exam question pools with vecs responsible for creating actual tests therefrom. the league will petition fcc to require two or more general class operators to administer a novice test. the executive committee will study the need for a revision to fcc rules covering morse code testing.

counsel is to amend arrl petition on enhanced novice license, rm 5038, to maintain present power limits in novice bands below 28 mhz. persons designated by special service clubs will be able to certify awards for was, 5bwas, and vucc. the arrl qso party contest will be discontinued. the ecac was charged with reviewing the current limit of one hour for races test and drill periods. the board created an ad hoc committee on spread spectrum standards.

the board adopted a reduced arrl membership rate of 6 dollars and 25 cents per year for youths under 13 years of age, and a rate of 12 dollars and 50 cents per year for under 18 years of age. staff was encouraged to cooperate with and supply information about amateur radio to youth groups. there is also to be a program designed to integrate amateur radio into the curricula of the electronics and communications schools of the nations armed services.

the arrl executive vp is to submit to fcc a preliminary proposal to provide it assistance in assigning amateur callsigns. ways of strengthening the arrl field technical information service are to be studied. recommendations pertaining to strengthening of crrl were approved.

the 220 to 225 mhz band plan is changed to show repeater channel spacing of 20 khz rather than 40 khz. there is to be a study of the band plan for 420 to 450 mhz regarding repeater input output relationships, but 25 khz channel spacing is endorsed now. the 23 cm band plan regarding fm repeater offsets presently set at 12 mhz is to be reevaluated. the board also adopted a bandplan for the 24 mhz band as follows, 24.890 to 24.920 mhz cw only, 24.920 to 24.930 mhz cw and digital, and 24.930 to 24.990 mhz cw, phone and sstv ar

qst de k9eui
hr propagation forecast bulletin nr 30 from arrl headquarters
newington, ct july 28, 1985
to all radio amateurs bt

the solar flux rise predicted last week began 2 days earlier than expected. after 6 days at 69, ending july 24, the solar flux rose steadily, reaching 79 on the 28th. two minor sunspot groups came around the east limb of the sun last week. the second of these is low on the sun, giving rise to speculation that it may be a forerunner of cycle 22. an earlier low latitude spot was visible for only 4 days, beginning july 17. it did have little effect on the solar flux level for its short life.

the area of the sun responsible for the flux peak of 101 on july 9 will be in view again about august 1. it is too early to tell if it will be of major importance this time around. a broad peak somewhat below 100 is a fair guess, for about august 4 to 8. more on this next week.

sporadic e layer ionization seems late in reaching really interesting proportions this year. it is still showing up almost daily, and may have some surprises left. do not rule out transatlantic dx on 50 mhz. it has happened in august before, and the best e skip was late in starting this year. for those interested in much lower frequencies, the best propagation is likely after about the middle of august, when the solar flux is expected to be at its lowest for the month. atmospheric noise will remain troublesome on the low bands much of the time until early fall.

american sunspot numbers for july 18 to 24 were between 8 and 18 with a mean of 11.1 ar

I purchased an ICOM IC27A late last year. For the features, it is
the best deal for the money (at least compared to the rigs available
to me at the time). I wanted memories I could scan by pressing the
up and down buttons on the microphone, which the IC27a has. It is
the only radio I know of that has builtin front panel dialable PL.

The Yaesu FT270RH looks quite nice, but it is more expensive
initially and you must pay for PL (which I believe then becomes
front panel dialable).

But - the IC27a isnt perfect. I am very dissappointed with the audio -
in my truck its difficult to hear it at times, even with the audio
all the way up. My old Kenwood TR7730 had excellent audio. My unit
also had an intermittent develop in the signal strength display.
For some strange reason the speaker I had on the TR7730 does not work
with the IC27a external speaker jack - there is a ripple present
whenever I try to use it. The same speaker still works great with
any other radio I try with it, and other speakers work with the IC27a.
Very strange.

Does anyone know anything about the new Butternut miniature beam? It
sounds very interesting - a six foot boom, 11 foot wing spand, covers
20,15 and 10 - without traps. The usual claim of 'using the entire
antenna on every band' is made. I believe they mentioned something
about an option for the WARC bands also.

Regency

WHAMO-10: Regency's first synthesized scanner. Discontinued long ago. Appearance more like a crystal scanner, with a single LED per channel. User has to break off metal teeth on a 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use.

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both
UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting to front ends via a capacitor). Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up ad hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for
best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning cir-
cuitry may become confused at times, but power off/on restores sanity. Not all that bad a deal if cheap. Replaced by Regency ACT units.

Radio Shack (made by GRE of Tokyo)

PRO2001: Early, discontinued single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch

for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: Discontinued 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Front mounted, vertical speaker always a win.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (div. of Pioneer)

4530: Discontinued Japanese 10 channel crystal controlled 3 band unit. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Tennelec

Manufactured the first synthesized scanners. Company out of business for last several years. Schematics and parts difficult to obtain. Radios reputed to be poor performers. I got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

>and I alone are not the ones to decide the fate of this new group, are
>we?

I'm with Gene. I don't really care particularly about ham radios and
such. I do care about the net. Even though we're (I'm) relatively new
to the net, we've already run into concerns about the volume of traffic
propagated around the world. If criticisms appear about the size of
people's SIGNATUREs, why shouldn't we be concerned about passing narrow
special-interest traffic around the world?

Both a local site and the site to which we feed news have already posted
their subscription exclusions because of the amount of traffic. In a
related issue I recently corresponded with chuqui@nsc about starting a
Plexus User Group group. His response corresponded very closely with
Gene's attitude: use a mailing list if the interest group is not large
enough to warrant net traffic.

I firmly believe in your right to communicate on a subject of interest
via the network. The network is a fantastic privilege. With that
privilege is responsibility. Should the rest of us incur the cost of
communicating information of interest to only a few?

I don't have an answer, just a whole bunch of questions. I would like
to have more of a feel for how many wish to see your proposed subgroup
established before seeing that happen.

***

The only possible reason I can think of is, since the microprocessor
probably needs RAM for scratch pad and storing of transient parameters,
it may be cheaper to include one RAM for BOTH this and the microprocessor
program. I can imagine some 'clever' engineer realizing he could eliminate
one whole component and a bit of board space if he combines the RAM and
ROM functions into a single IC. Plus, he suddenly has the built-in feature
of nonvolitile user-settable parameters, since he has to battery back-up
the ram anyway. 'Nifty!' he says to himself. This kind of engineer should
be drowned at birth.

BTW, I bet if you're very careful, you could replace the battery yourself
without killing the ram. I for one wouldn't want to try it. Then again,
I probably would not buy such a product in the first place.

hr propagation forecast bulletin nr 25 from arrl headquarters
newington ct june 24, 1985
to all radio amateurs bt

there is much to be said for contests, especially the most
popular of all, the arrl field day. generating band occupancy
far beyond other contests, field day can be a two day lesson in
radio propagation.   if june 22 and 23 had been just another
early summer weekend, would thousands of stations all over
north america have been clamoring for attention on 21, 28 and
50 mhz?

of course not, and this ((w1aw carrier dropped on 20 mtrs - switched to 15 mtrs)).....

ten and six meters have had much less use than they merit, since solar flux and sunspot numbers dropped to near minimum levels months ago. the solar flux was 69 on field day saturday and 70 sunday, but e skip on these bands made this one of the most exciting field day weekends on record.

the sun has been spotless for several days, and it is likely to continue that way through this week. a rise is expected near the end of june, but whether the numbers rise or fall, e skip will continue to dominate the propagation picture for another five or six weeks, and it is not predictable in any precise way ar

fcc has fined james brantley, k6kps, 2000 dollars. the fcc had received complaints over a long period of time that brantley was disrupting amateur communications. on december 19, 1984, commission personnel observed brantley on several 20 meter amateur frequencies making lengthy cq calls and calling nonexistent stations. he did not make contact with any station, even though two stations made numerous attempts to respond to his cq calls. it became obvious that the purpose of these transmissions was to disrupt normal amateur communications. k6kps ignored the complaints of other stations on the frequencies. brantley was cited for violating section 97.113 which prohibits broadcasting by amateur stations. the fine was issued june 13, and brantley has 30 days to respond ar

NEW CORDLESS PHONE DISTANCE RECORD?

by Bob Parnass

NAPERVILLE, Ill. - If you use a cordless telephone, you may be overheard by people 1000 miles away.

Jack Albert, a radio hobbyist in New Lenox, Illinois was watching TV channel 2 the evening of June 23 when he noticed another TV signal competing with the local Chicago station. Suspecting a "band opening", a natural phenomenon in which radio signals "skip" off the ionosphere, permitting reception of signals from extraordinary distances, Albert turned on his 6 meter ham radio receiver and found that conditions favored reception of signals from North Carolina.

Retuning his receiver to frequencies adjacent to the ham band, Albert's attention was drawn to two people conversing amidst the clamor of several other cordless phone conversations. When asked why he was sure that the parties were in North Carolina, Albert stated that both parties had "North Carolina accents" and that the slow fading pattern on the cordless phone signals matched that on the ham signals from the same state.

Albert regularly uses his 25 year old "Clegg Interceptor" receiver, connected to a 5 element beam antenna on a 45 foot tower, to monitor radio signals from his home station WA9FVP.

Radio hobbyists report that reception of cordless phone conversations from distances of one to two miles is common, but this may set the distance record in reception of these signals.

xx

I have tried twice in the past few days to hear the RS5 and RS7 satellites on 10m with no success. Both times were in the early morning (~3:30 a.m. E.D.T.). Do these satellites have an operating schedule that includes a period in which both the beacon and transponders are off?

I have heard the satellites in the past and believe my equipment adequate: ICOM R-70 and external dipole.

Any ideas?

Thanks,
Jim Boddie, NG2J

       YAESU FRG9600 VHF/UHF SCANNING RECEIVER:

PRELIMINARY COMMENTS

A friend of a friend (of a friend) tried the new Yaesu 60 - 905 MHz scanning receiver, with these comments:

- Apparently good sensitivity on all ranges, but noticeable intermod in the 150 - 160 MHz range.

- Only 10 of the 100 channels can be scanned.

- There is no way to lock out a channel from the scan list.

- The tuning knob makes a "clicking" sound as it is rotated, and it takes several turns to tune even a small band segment.

- Relatively slow scan and search rates.

- Scanning algorithm pauses on an active channel for at most 7 seconds, then resumes scanning abruptly, causing interrupted transmissions.

- Scanning fails to stop sometimes, even on strong signals.

The reviewer assessed the FRG9600 "a failure as a scanner", although it is ok as an SWL receiver for higher frequencies.

qst de k9eui
hr propagation forecast bulletin nr 26 from arrl headquarters
newington ct june 30, 1985
to all radio amateurs bt

solar flux and sunspot number curves for june were quite similar to those for may, except that they were mostly a few points lower. this is to be expected, as cycle 21 will be 9 years old this week. the june flux average was 73.2. only march of this year was lower, with 72.5. the solar flux curve is presently above that for the same point in the previous solar rotation, but it is expected to peak more, probably early next week.

anyone using 21 or 28 mhz regularly of late has found these bands busy, thanks to the seasonal peak in sporadic e layer ionization. because this mode is sporadic, and largely unpredictable as to timing, its effects are not included in the propagation charts that appear monthly in qst. e skip is good mainly for distances under 1200 mile most of the time, so it is not normally thought of as a dx medium. multiple hop effects can extend its useful range markedly during early summer. the 10 meter band has been open to europe from the east coast recently, and even austrailia and new zealand have been worked now and then. the possibility of transatlantic e layer dx on 50 mhz should not be overlooked, though it is quite rare this high in frequency, especially over more than about 2500 miles.

propagation was erratic as this bulletin was being prepared. geomagnetic activity was rising, and rapid fading was troublesome. there should be some improvement later in the week but more disturbed conditions are likely again july 4 to

8. july 10 through 18 will bring more stability, and generally
good summer propagation when electrical storms are not making
noise a problem.

american sunspot numbers for june 20 through 26 were between 1
and 16 with a mean of 7.1 ar

I just saw the first review of the FRG9600 and though
it was time I added my two cents also.

       YAESU FRG9600 VHF/UHF SWL RECEIVER:
                 AND THE MX5000 COMMENTS

I have had a Yaesu 9600 now for almost a month and these are
my observation and comments on this swl receiver. I also have
the RS232 interface and have been able to program it from my
computer. I have had the MX5000 for about 6 months that is the
only other receiver I can use for comparison.

Conclusion:

The FRG9600 is a great SWL receiver but is not really design
for a scanner. I have both the MX5000 and the FRG9600 and if
I could only have one I would pick the FRG9600 as most of my
receiving is listing to satellites and SWL like activities.
The unit is easy to use and to program from a computer.
The unit is in a shielded case and little intermod / birdies
have been found. I do a lot of monitoring of the 137 MHz
band and the MX5000 has problems with a local FM station but
the FRG9600 does not. This may be why the sensitivity of the

FRG9600 is not as good as the MX5000. I am glad to see that the scanner are going towards SWL receivers, but where is the cw filter, the agc selection, bandpass tuning etc.

- The sensitivity of the FRG9600 is not as good as the MX5000 but it is not as susceptible to microprocessor noise as the MX5000 is. I have not done any measurements but by simple step attenuators test I would assume that there is about 3 to 6 db of difference.

- The scanning routine is very bad, it stops on a channel and then continues. There is no option to stop on scan. It sure would have been nice to have the unit send out the freq. on the RS232 line. I still wonder if that is what they had in mind when they had it stop and blink one digit at a time and then continue scanning.

- The programming of the unit from the keypad is very easy and straight forward. All commands are done the same way not like the MX5000 which requires a different sequence depending on what scanning mode you are in and if the squelch is open or closed. I found the rotary dial to be easy to use an much like the two meter FM units, with the variable rate tuning steps one can easily tune threw bands. The only exception is in the ssb/cw mode where the step is fixed and not adjustable.

- The RS232 interface is simple a RS232 level converter to TTL levels (? 0 and 3 VDC and level inversion switching to invert mark and space if needed). The baud rate is 4800, and there is restriction on the time for all 5 character to be sent to the receiver. The odd part is the fact that there is a requirement of two stops bits. I am not sure why as the industry standard is 1 stop bit above 300 baud. This gave me some problem as my computer only did one stop bit, at first I could not program the unit because of this. After many hours of scopeing out the signals I determine if I put in a delay between sending characters to the FRG9600 I could fake out an extra stop bit. I use about 1 ms as that is what my delay loop first came out to be but any delay that is greater the 1.5 bit time should be enough. After this I found it very easy to program the mode and frequency of the FRG9600. These are the only command one can program. It would have been nice if you could program the selection of the memory channels but you can not and it would have been nice if you could use the step size and stepping and features but you can not. It also would have been nice if they had brought out the squelch to the RS232 interface but they did not. I did bring out the squelch line and tied it it data set ready of the RS232 line.

- From the computer interface one can set any frequency independent of the mode to 100 hz and it dose not snap to the nearest mode dependent step size. This is a very nice feature for odd frequency and in automating doppler shift correction for monitoring satellites.

- There is a clock and timer on the unit but it is not assessable to the RS232 interface. The clock is not battery backup like the MX5000 but all the memory channels are.

- Separate squelches are provide for AM/WBFM and NBFM. It seems to work well except for AM.

- The ssb detector is very good, I was lucky to receive the unit just before the VHF contest and copied may ssb/cw station in the 144/220/432 MHZ bands. They are easy to tune in.

- I have ordered the Video interface for it , but it is not available yet.

- External connections allows one to get the following signals, squelch, agc voltage, audio, if output and more . Those are the one I remember as I do not have my manual with me. The connector for the ant is a standard PL259 type connector, it should have been an N type connector.

Living around Boston, I have heard several walkie-talkies that the transit police carry and also the EMS ambulance people. They all seem to be Motorolas. Anyway, it seems that when the base station releases its mike key, a couple of single tones are transmitted, very rapidly, one after another, each about 100mS long, with no space in between them, the first tone higher in freq than the other. One is about 1.5kHz and the other a bit lower, maybe around 1kHz. WHAT are these for?

All comments appreciated.

Just tried out a shiny new ambulance with all of its electronic goodies (work part time as an EMT in my town) . Anyway, it has a new Motorola radio with the standard PL on/off slide switch on the microphone holder. Here comes the question: When the PL switch is off, the receiver audio is muted by the normal squelch circuit which allows you to hear receiver hiss for about half a second after the repeater shuts down, then all is quiet. When PL is on, receiver audio is heard, but right after they finish speaking, the reciever is muted and no squelch tail is heard. Are they or are they NOT shutting off the transmitted PL tone BEFORE thaey allow the repeater transmitter to shut down? This is what it sounds like.

Next question: Why does store bought 2m ham gear usually try to sell itself with a PL tone encoder ONLY? It seems that all of the commercial radios like in the previous question (even the walkie-talkies) have BOTH an encoder and a decoder. Is it because PL tones are really used in ham radio as an electronic "key" or access device to allow only those lucky few to access a closed repeater? I can see two reasons to use PL tones in commercial gear: 1) It allows several local services to use the same frequency without being

disturbed by one another's received audio.
2) On low-band systems (usually repeaterless) it eliminates received "skip" from everyone's radio listening.
  I suppose PL encoding and decoding could be used on 2m within a group of people so they would not have to listen to all of the repeater gossip if they were expecting a call from a certain ham operator.

While I am on the subject of private encoding/decoding:
   Is it legal to use this scheme on amateur radio? What if I have a tone decoder circuit in my mobile set that will only open up the receiver audio if it receives two or three DTMF pairs in the proper sequence? A typical scenario would go like this: Another ham tries to contact me by on or off off a repeater by saying my call, "this is", then his call, then using her or his DTMF pad transmits a sequence of tones. Do you think this would piss off people listening to the repeater, thinking that I am trying to access some repeater function (such as autopatch) when I don't EVEN BELONG to their repeater group or club?

Last question: on commercial FM gear, is the PL tone transmitted by a mobile set filtered out before the signal is retransmitted by the repeater???

..............I'm just full of questions today.

True sub-audible PL as done by Motorola uses a technique called
``reverse burst'', in which the transmitter emits PL for 120 ms after
you release the microphone, but 180 degrees out of phase with that which
was sent during the main part of the transmission. Its frequently
louder too. The idea is to cancel the vibration in the mechanical
decoder reed at the receiving station, so that the tone squelch will
shut before the received carrier goes away, thus eliminating the squelch
tail.

(Note to ham radio newcomers: the ``squelch tail'' is the burst of white
noise heard as an FM receiver squelch delays closing for a short period
of time. It is NOT (as I have heard ignorant people say on local
repeaters) the delayed drop-off time of the repeater. It is perfectly
possible (and common) to have a squelch tail when there is no repeater
involved at all.

More recent Pl systems use a quick burst of digital code sent at the
beginning and end of each transmission. This DPL can address lots of
different stations both by group and individually, so its more flexible.
By combining it with dual-rate squelches (close fast on strong signals,
more slowly on weak signals that may be fluttering), even if the
trailing code burst is lost, the majority of squelch tails will be
eliminated.

>Next question: Why does store bought 2m ham gear usually try to sell itself
>with a PL tone encoder ONLY?

Most rice-rockets can have a decoder added to them, but since the great
majority of them have really shitty low-frequency audio response (small
speakers, little coupling caps, etc), most repeater operators choose not
to repeat PL tones through their repeaters. It is possible to do so, by
either of two methods - a tone coupler will repeat PL tones through
(under the squelch, so that reverse-burst will continue to work), or by
having an encoder on the repeater transmitter. So although its possible
to have a decoder, since most people won't have one, and the tones will
really distort audio in their receivers, repeaters generally don't emit
tone.

Tone bursts in the audible range, DPL, touch-tones, etc as selective
station calling devices have been used in ham radio off and on for
years, and I have not heard of their legality as such being questioned,
but they are unpopular for a number of reasons: They are annoying as
hell to listen to, and the general air of cliquishness they generate
usually pisses off enough people that they record and play back the
tones to annoy the members of the clique. (My, aren't repeaters FUN?)
Better to move to another band and put up a private system.

>Last question: on commercial FM gear, is the PL tone transmitted by a

Baltimore City has the{k bleedles. They are a data burst. They transmit
call information to the stations and engines. The officer in the engine
just pushes the buttons to indicate the situation on arrival at the scene.
I think the trade name is something like MODAC.

While their are some repeaters around here that have PL to keep out the
"riff-raff," the only repeater that I generally use installed PL to stop
interfering signals from unintentionally bringing up the repeater. This
can either be due to another repeater on the same frequency, or as in this
case, a cab company with a bunch of poorly maintained AEROTRON commecial
radios. We allowed the repeater to be brought up using any one of the
following three methods:

1. PL.
2. Any Touch Tone
3. Three kerchunks within one second followed by the carrier
   staying on.

This is often done with what's called "tone reversal". When the Push-to-Talk
line on the transceiver is released, the tone encoder holds it on for about
another 100 ms. During this time, the PL tone is sent out, 180 degrees out of
phase. This serves to turn off a PL decoder as quickly as possible. In the
days of reed-based decoders, it damped the vibrations of the reed. The 100 ms
time was just long enough to shut down the decoder without it locking onto
the 180-degree signal.   RCA TACTEC (TAC100) radios do this, for example.

I always thought having a decoder on my rig would be a good idea. I don't
think it would be illegal -- you're not broadcasting, you're signaling a
specific individual. And no matter what you do, you're bound to make someone
mad at you! :-)

>

>

Yes. In some rare cases, a *different* PL tone is used on the output than
on the input. That, of course, requires complete filtering on the receiver.

     I think what you heard are the tone signals generated
     by   the remote control unit located   at the base operator
     position.   This control unit is probably connected
      via
     dedicated "phone" lines to the actual transmitter.

     Since these "phone" lines have no DC continuity, tone
     signals are used to remotely control the transmitter
     (e.g. transmit, receive,   change   channel,   etc).
     Although these tones are supposed to be muted to
     prevent their transmission over   the air, it's
      not

uncommon to hear them "slip out".

I hear these tones on the Bolingbrook (IL) Police base on 155.250 MHz, and the Illinois Department of Transportation on 151.100 MHz.

x
MEMORY BACKUP TROUBLE IN YAESU FRG8800 RECEIVER

A few months ago, I posted an article revealing that critical information is stored in the ICOM R71A's RAM, requiring factory reprogramming after the lithium backup battery runs down.1

Readers may be interested in the memory backup anomalies of other receivers. From Geoff Halligey's "Below 30 MHz" column in the July 1985 issue of the RCMA Newsletter:

"A friend in the U.K. exchanged his R2000 [Kenwood SWL receiver] for the new [Yaesu] FRG8800. He was delighted at first, but after 3 or 4 weeks the readout went blank and no signals. He found the backup bat-

teries fully discharged. Hastily returning the receiver to the dealer, a new replacement was sent out - three weeks later the same thing again."

"The dealers have now told him that they have had a number of similar complaints and they point out that the manual states that continual switching on and off the receiver will considerably shorten the life of the backup batteries."

"But three weeks in normal use is ridiculous."

It's not clear just what is stored in the FRG8800 RAM: user memory channels, critical operating parameters used by the microprocessor controller (as in the ICOM R71A), or both.

Does the FRG8800 use rechargeable NiCd batteries for backup? Are they charged only when the receiver is "on"?

On a repeater however, you hear the squelch tail from the repeaters
receiver being retransmitted. If you have remote receive sites, the
problem is compounded. You can get around this by delaying the repeated
audio by enough time that when the COS from the reciever dies, the
squelch tail in the delay line is dumped. Of course, there isn't a
whole lot you can due about the squelch tail in the user's receiver.

PL is used not just for security or access to a "private" repeater and/or
functions, but also to prevent interference. On 10M repeaters, each
area of the country has subtones that it is supposed to use for
repeater access. This prevents skip from one area of the country from
activating all the repeaters in another part of the country. It also
can be used to prevent interference where repeater coverage covers
more that one metro area, for example, New York to Boston. There are
probably some sites that if PL was not used, keying up would probably
bring up many machines in the area.

As to decoding the PL on a receiver, Kenwood did something similar
except they use ASCII transmission of your call sign in the TR2600

handi-talkie.

As to the legality of PL, there really isn't a problem. It's not
cryptic data and it conserves bandspace.

qst de k9eui
hr propagation forecast bulletin nr 27 from arrl headquarters
newington, ct july 7, 1985
to all radio amateurs bt

active areas of the sun responsible for solar flux peaks in
early may and june have been on the visible disc of the sun
again since july 1. the lead group is shrinking, but the
second is larger and more complex than during its june
appearance. the solar flux rose from 74 on july 1 to 95 on the
7th, its highest since july of last year. all visible activity
is now in the western half of the solar disc, so the flux and
sunspot numbers will be lower this week.

as predicted last week, geomagnetic activity associated with
the more active sun made for erratic dx conditions on our lower
frequencies. more stable propagation and lower muf are
expected after about july 9. transatlantic dx was worked on 50
mhz during the evening of july 2, and again around midday on
the 7th. there was also 50 mhz work to south and central
america on the latter date. we may have passed the early
summer peak for e layer dx on 28 and 50 mhz, but there will be
frequent openings during july. there is no close tie in with
solar flux peaks or valleys for the e layer mode, but the four

week solar rotation period is worth noting. on that basis we expect a fall off in the middle of july, and a final upsurge at the months end.

a gradual change to f layer propagation and longer skip distances will be noticeable on 21 mhz and lower frequencies in august. as e skip drops off, 28 mhz will seem quiet but there is a good possibility of long haul f layer work on that band in the fall months. more details on this prospect will be given in a few weeks. ar

The Girl Scouts of Monmouth county would like to help young women become more involved with careers in the electronics and communications industry. They are in the process of setting up a program for senior scouts and are seeking donations of amateur radio and CB equipment. They are specifically seeking all types of CB radio items such as antennas, mobile units and base stations. They would also like to set up an amateur radio station covering the HF and 2 meter bands. Equipment would include the radios, antennas, tower and support equipment such as a tuner and SWR meter. If you can help please contact Judy Mazza at (201) 938-5454 or Charles Burke (201) 566-1800 ext 353. Thank you very much for any help you can provide.

Charles Burke, WA2SLK

A few issues back in the Review of International Broadcasting
an article set out a simple and elegant modification to the
ICOM R71A which would convert the PBT (actually a variable width
filter scheme) into true passband tuning. Does anyone know of
a way to do this for the R70? Or does anyone remember seeing
any articles on this? Is there any reason to believe that designs
of the two radios are such that it should be equally easy to
do this?

Thanks

Richard Shapiro

p.s. Thanks to Bob Parnass for pointing out that the R70 does
not suffer from the battery-backed RAM problem which afflicts
the R71A.

Any of the tone schemes you mention would be legal for ham use.

A repeater supposedly filters out the mobile's PL tone (it's supposedly "subaudible" anyway). However, on my Motorola HT-220, I can hear the PL tone from another HT-220 after going through our Motorola MSY repeater (MIT 449.2). I can't hear it continuosly, but only as a quick, chiming tone at the beginning of the transmission. Maybe what I am hearing are higher-frequency transients as the electromechanical PL reed is starting to vibrate.

There could be a few reasons for the apparently shorter tail heard when using PL squelch. Some radios (repeaters in particular) transmit a so-called "reverse burst". When the radio is about to unkey its transmitter, it quickly reverses the phase of its PL tone. This causes the PL squelch circuit to turn off faster. This is useful with the electromechanical reed type of PL circuit; I don't think it would be necessary with an all-electronic PL squelch.

Hams tend to use PL only for keying up a closed repeater or preventing a repeater from being keyed by interference or grunge. However, it can be very nice to have an HT or mobile rig that can provide PL squelch as well as "PL transmit". If you are driving around an urban area where there is a lot of grunge, you will often find your rig unsquelching on all sorts of garbage. Enabling your PL squelch will keep your receiver quiet until the repeater you are listening for starts outputting the proper tone. In fact, this is how we run the 449.2 machine; we do not require a PL on the input to key the machine, but the machine does output PL for those who want to use it. Also, I often open up the noise squelch and enable the PL squelch on my HT when I am trying to work a weak simplex contact. I find that my PL squelch is more reliable on weak signals. Of course, the other guy's HT has to transmit the right tone.

One other ham use of PL is known as "anti-PL". About a year ago, our repeater started talking to a new machine in Philadelphia that was "upside-down" from us (444.2). The two machines talk to each other about once a week, often strongly enough to carry on a QSO with the people in PA. In order to prevent this from becoming annoying, the operator of the Philly machine installed a circuit that prevented his machine from keying if it heard our PL tone. Of course, when a local Philly user keys his HT, his (hopefully) much stronger signal will capture the Philly machine. This makes our tone "disappear" and their machine will key up.

Lastly, the only made-for-hams HTs that I can think of that support PL squelch are those made by Yaesu. The FT-208R and FT-708R and now the FT-209R and FT-709R allow for options that give both PL encode and decode.

Hope this helped...

FOR SALE -> ICOM IC-R70 SHORTWAVE RECEIVER

Hear - Standard Time Signals - "tick...tick...tick...When the tone returns..."
Hear - International Broadcasts - "BBC World Service presents..."
Hear - Ham Radio Operators - "dah-di-dah-dit dah-dah-di-dah..."
Hear - CB Radio Operators - "Ten-four, Good Buddy..."
Hear - Mystery Numbers Stations - "uno nueve dos tres..."
Hear - Cordless Telephones - "The number you have reached..."
Hear - Strategic Military Comms - "Skyking, Skyking, do not answer..."
Hear - Radioteletype - "RYRYRYRYRYRYRYRYRY..."
Hear - Drug Smugglers, Pirates, Wierd Signals and much, much more!

IC-R70 Features:
>Frequency Coverage: 0.1 - 30.0 MHz in 10 Hz steps
>Modes: AM, CW, SSB, RTTY, FM (has optional FM unit)
>Selectivity: SSB - 2.3 KHz @ -6 dB; CW - 500 Hz @ -6 dB
>Sensitivity: 0.15 uV for 10 dB S+N/N
>Other: 2 VFOs, Passband Tuning, Notch, Noise Blanker,
              RIT, 117 V, 111 mm x 286 mm x 276 mm.
Asking - $400.00

Yes, it is legal to use "PL" tones or DTMF tones for signalling as long
as that particular mode is authorized on the band you are using.

Remember one thing that MOST commercial stations using tone activated
receivers forget: DISABLE THE TONE CIRCUITRY BEFORE TRANSMITTING.
That is, except on the 440 MHz ham band, it is illegal to transmit on
a frequency before monitoring it. You can't do this unless you revert
to carrier squelch!

All "decent" repeaters that use subaudible tones have a 300 Hz (or so)
hi-pass filter in the audio path so the tone is not repeated. I really
hate to hear systems where people have their "PL" cranked up so high
that it garbles the voice.

Regarding the discussion some months back about $100-range shortwave
radios: Radio Shack is discontinuing their DX-400 radio (the same radio,
with slightly different cosmetics, as the Uniden CR-2021, which was
closed out last year for $90-$120 from various sources). I've seen it
at at least one R-S store on a "manager's special" for $149.95. As
stocks dwindle, I wouldn't be surprised to find demo models or the

last one in stock for even less -- it might be worth haggling over, even.

I wonder what will be coming out in the future to fill this void -- I would expect more Korean/other Asian makers to copy Sony models, the way Uniden copied the Sony 2001 for this one. Anybody out there in the trade have any word on new digital-readout SW portables? Or has the Asian SWL boom run its course (as it has in Japan), and Sony will have no competition in this area?

Regards, Will

This is why the mike "hook" switch disables PL when you pick up the
mike.

| > (Note to ham radio newcomers: the ``squelch tail'' is the burst of white
| > noise heard as an FM receiver squelch delays closing for a short period...
| ... Of course, there isn't a
| whole lot you can due about the squelch tail in the user's receiver.

+---------------

Actually, with some fancy coupling between the squelch and AGC circuits,
it should be possible to eliminate most or all of the "squelch tail".
The squelch tail occurs because the AGC gain opens up faster than the
squelch closes. By using a longer time-constant on AGC decay than on rise,
and by tying the time-constant to whether the squelch is open or closed
(you want a long decay if squelch is open), the "tail" will be heard as
QUIETER than the transmission, not louder. Of course, this means that the
squelch cannot be controlled simply by the AGC voltage (as is often the
case in simpler designs), or you'll get "motorboating" oscillations in
the squelch.

A possible algorithm is to use AGC voltage to OPEN the squelch (and switch
the AGC time-constant to "slow"), but then use some ratio of actual input
R.F. to "estimated" input (i.e. the AGC voltage) to trigger the CLOSING
of the squelch.

Careful design is needed in mobile rigs (or anywhere fast fading can occur)
to make this work, and of course impulse noise has to be treated carefully
as well. Note that the "slow" AGC decay (with squelch open) need not be
"slow" by human standards, only "slow" compared to the time-constant of
the squelch-closing detector.

Note that a squelch tail will still exist -- it just won't be so annoying.

p.s. Hmmm... maybe the problem is not the AGC, but the squelch open/close
detector. Mayebe all you need to do is make the squelch OPEN slow (compared
to impulse-noise rejection time) and CLOSE fast (compared to AGC recovery time).
That would get rid of the "tail" entirely.

I don't know about the other equipment but you'll probably have to pay
someone $50-$100 to take the Model 19. Too bad, it was a pretty neat piece
of gear in its day, but, its day ended 3 to 5 years ago. I, sadly, took
mine to the dump early this year to make room for some goodies that won't
be obsolete until next year.

PACKET RADIO USED IN FIGHTING BRUSH FIRES

[The following is a report filed by Wally Linstruth, WA6JPR from an ongoing emergency operation. It is meant to convey the initial experiences of using a new, potentially formidable technology under emergency conditions.]

Packet radio is playing an important role in aiding firefighters involved with the Wheeler Gorge forest fire that is still raging in the forests and brushlands east of Santa Barbara, CA. Bill Talanian, W1UUQ, President of the Santa Barbara Amateur Radio Club, reports that over 200 messages have been cleared from the fire area in the last few days. The traffic consists of approximately 50 percent health and welfare and 50 percent official fire department disaster-coordination messages for relay to the northern part of the state.

The WESTNET digipeater system and the W6IXU mailbox are being used for much of the traffic. Traffic is also being cleared to NTS through Los Angeles area hams and WESTNET.

The versatility and simplicity of the simplex digipeater was proven when the KA6SOX-1 Painted Cave digipeater was easily moved to La Cumbre peak for a better path into Pendola Camp, the main fire control point. A duplex repeater was also rapidly converted to a digipeater to enhance WESTNET coverage of the fire area.

All is not roses, however, and we will have much more to report after the conclusion of the current activity. The problems uncovered during this emergency will provide serious food for thought for the packet-radio community. Two problems that have already been identified are:

o Line-by-line entry is tedious and error prone. This is compounded by the fact that (at least here) the people involved in packet technology are not uniformly well trained in emergency traffic-handling procedures. Also, the well-trained ARES operators are not familiar with the details of TNC operation. This problem was handled by W1UUQ who received most outbound traffic at his home where the messages were reformatted using his word processor and retransmitted to their ultimate WESTNET destinations.

o The California State emergency agencies have been convinced that packet is superior to means of sending messages. Because of this, state-purchased packet gear was being used in preference to ordinary traffic-handling methods, even though it was obvious to

the control operators that traditional methods were operating at higher efficiency. This situation got worse when the W6IXU mailbox became congested because there is not yet a "data highway" from packet into NTS.

We can draw one moral from these experiences, even before the final report has been filed: Make sure that you have a working packet-radio traffic-handling system before you "sell" packet to government authorities.

Expect a more detailed report soon.

From WA6JPR.

PACKET AT THE JACKSON-HOLE HAMFEST

The 1985 Wyoming-Idaho-Montana-Utah (WIMU) Hamfest, which will also be the ARRL Rocky Mountain Division Convention, has scheduled several packet-radio events. The hamfest will be held in Jackson Hole, Wyoming, August 2-4. Here is a tentative schedule of packet-radio happenings:

Fri. 3 P.M. The Packet Radio hospitality room swings into action.

Fri. 7 P.M. All packeteers go to the Bar-J Ranch for a chuck-wagon dinner and Western variety show.

Sat. 8 A.M. Packet talks begin, continuing until 10 am. The primary speaker will be Pete Eaton, WB9FLW.

Jackson Hole, at the doorstep of Yellowstone National Park, is a great place to take the family if you want a combination vacation and hamfest. Plan your vacation so that you get both the best scenery and the most up to date packet radio information.

From N7BHC.

EMERGENCY LOCATION WITH PACKET RADIO

Dave Pederson, N7BHC, suggests a potential public-service use for high-altitude digipeaters. He suggest that we develop an emergency locator transmitter (ELT) direction finding (DF) receiver be interconnected with a packet station. Information from the DF receiver could be relayed via packet to search and rescue authorities. The high-altitude sites occupied by many digipeaters would be quite good for receiving ELT beacons.

A computer-controlled ELT DF system attached to a TNC could send out an emergency beacon whenever it heard an ELT (outside of standard testing times). The system could then update DF information periodically or on command. Dave provides further

details of this idea in an article in the July issue of UPRA Connect.

Via N7BHC.

JAS-1 UPDATE

JAS-1, the amateur radio satellite built by the Japanese Amateur Satellite Corp. (JAMSAT), is complete, and should be launched in August of 1986. Along with a linear transponder operating with a 2-meter uplink and a 70-cm downlink (mode J), JAS-1 will carry a "mode-JD" digital store-and-forward transponder. This transponder will operate like an orbiting packet bulletin-board system (PBBS), and ground stations will use AX.25 TNCs and special modems to access the satellite.

With two flight-ready satellites complete (a primary spacecraft and a backup), specifications of the mode-JD transponder are becoming available. The following details come from the "Satellite Update" column in Amateur Radio Action, an Australian ham magazine.

The transponder has four uplinks in the two-meter band and one downlink in the 70-cm band. The single downlink will be able to keep up with multiple uplinks because there will be frequent uplink collisions between ground stations that can not hear each other. The uplinks, on 145.85, 145.87, 145.89 and 147.91 MHz will use 1200-bit/s, Manchester coded FM. The 435.91-MHz downlink, will use 1200-bit/s, non-return to zero inverted (NRZI), phase shift keying (PSK).

While JAS-1 will probably be available to any appropriately-equipped ground station, it is likely that most stations will access the satellite through teleport stations. The use of central teleports has several advantages: users without satellite antennas will be able to take advantage of the satellite, time and money invested in building special modems will be reduced and contention for the satellite's uplink channels will be minimized.

With JAS-1 mode JD, the RUDAK experiment on Phase 3-C and PACSAT all scheduled to be launched in the next year or so, the horizons of packet radio will soon be greatly expanded.

Via Amateur Radio Action.

ARRL COMMENTS ON AUTOMATIC CONTROL

The ARRL has filed comments on the FCC's proposal to extend automatic control to all amateur operations above 29.5 MHz (RM-4879). Excerpts from the ARRL comments follow:

"The League reaffirms its proposal that automatic control of digital communications be permitted on all amateur frequencies above 30 MHz as outlined in its Petition. In the Notice [RM-4879], the Commission has built upon the League's request, proposing that 'any amateur station may be under automatic control, except where transmitting on frequencies below 29.5 MHz.' In order to carry out its broader proposal, the Commission proposes to modify its Rules dealing with third-party traffic.

"It is unfortunate that the Commission has introduced the issue of third-party traffic into this proceeding. It detracts from the primary purpose expressed in the Notice of keeping the amateur service abreast of technological developments such as computer-based message systems (CBMS) and other digital technologies. The proposed third-party Rules also impose unnecessary and onerous restrictions on the development and operation of digital communications networks. In fact, the proposal as presented in the Notice will not allow normal operation of CBMSs, which is contrary to one of the Commission's goals as stated in the Notice. What is supposedly allowed radio amateurs by permitting automatic control is at the same time taken away by a proposed blanket prohibition from transmitting third-party traffic by automatically controlled stations as explained below."

The comments recall that the issue of third party traffic first came to importance in the late 1970s, with the growing use and abuse of repeater autopatches. The casual use of autopatches lead the FCC to issue a news release in 1978 reading, in part, "Section 97.79(d) states that 'the licensee of an Amateur station may permit any third party to participate in Amateur radio communication from his station, provided that a control operator is present and continuously monitors and supervises the radio communications to insure compliance with the rules.'" The Commission in the same notice also stated that section 97.79(d) clearly "prohibited autopatching and reverse autopatching through automatically controlled repeater stations and required a control operator to be on duty at all times during these operations."

From the ARRL comments:

"What the Commission was seeking to guard against then was the origination and introduction of communications into the amateur radio medium by unlicensed individuals.

"The commission misapplies this point in the [automatic control of digital communications] proposal, however, by seeking to prohibit 'third party traffic from any amateur radio station under automatic control.' A similar potential for abuse by unlicensed individuals in a digital amateur radio system exists only at the point where the third-party traffic is originated and introduced into the amateur radio medium. It is necessary to

require a control operator at this stage only. This control operator will guard against the potential abuse of amateur frequencies in a digital system just as effectively as the control operator on duty at a voice repeater station when an autopatch is accessed. To impose the additional burden of a control operator at every point along the digital system, be it at a CBMS site or at every packet 'digipeater' along the path to the message's destination is unnecessary. Such a requirement, in fact, would severely curtail the use of the developing digital technologies because the burden on control operators would be nearly impossible to shoulder. For example, messages on a packet radio repeater are received at a rate of 1200 words per minute, and retransmitted immediately at the same rate. This would require a control operator to examine each packet at a rate of 600 words per minute to keep up with the throughput capability of such a repeater. Furthermore, speeds higher than 1200 words per minute are authorized, and technology is advancing toward higher and higher speeds."

After this, the comments address the common practice of using automatically controlled voice repeaters to pass third party traffic. In conclusion, the ARRL says:

"We urge the Commission to modify its proposal so as not to impose a blanket prohibition of third-party traffic on stations operating under automatic control. We believe that the best way to achieve the goal of promoting the developing technologies in digital communications is to leave section 97.79 intact with the possible exception of clarifying section 97.79(d) by [adding the following text]:

> 'Participation means the origination, introduction or reintroduction of a communication into the amateur radio medium by a third party.'

"The proposed addition of this language to section 97.79(d) has the added benefit of clarifying that a control operator is required during operation of simplex autopatches.

"It is further urged that the proposed Rule sections 97.80(c) and 97.114(d) not be adopted, and that the Commission instead adopt the wording of 97.80, as originally proposed by the League, as follows:

"97.80 Automatic Control of Digital Communications.

> 'Amateur Radio Stations may be operated under automatic control on frequencies above 30 MHz when utilizing digital communications pursuant to section 97.69, provided that the control functions include (i) adequate provision for detection of transmitter

> malfunction and discontinuance of transmitter operation in the event such malfunction is detected; (ii) devices installed and procedures implemented to ensure compliance with the rules when a duty control operator is not present at a control point of the station. Upon notification by the Commission of improper operation of a station under automatic control, operation under automatic control shall be immediately discontinued until all deficiencies have been corrected.

"THEREFORE, the foregoing considered, the League recommends that the Commission extend automatic control to amateur digital communications above 30 MHz. The League also requests that the proposed blanket prohibition of third-party traffic transmitted on automatically-controlled stations not be adopted, and it urges that section 97 be amended by the adoption of section 97.80 as originally proposed by the League."

Ed.

NORTHWEST NEWS

The following update on the Northwest Amateur Packet Radio Association (NAPRA) comes from John Hayes, KD7UW, NAPRA's Technical Vice President.

"There is currently a network operating in Seattle on 145.010 MHz. In order to reduce the frequency of collisions and bring some organization to the frequency, use of the WN7ANK-5 digipeater is mandatory. Stations that can connect without the digipeater are encouraged to move to 145.050 MHz.

"Northern Idaho and eastern Washington are now also served by a 145.010-MHz digipeater, N7BI-4 on Mica Peak. Again, the suggested simplex channel is 145.050 MHz. The packeteers responsible for the N7BI digipeater are affiliated with NAPRA and work with us on network coordination. To facilitate this, we hold an HF net on 3885 Khz, Thursday at 8 P.M. Pacific Time.

"Doug Lux, WB6VAC, has been advocating the use of a 'channel-busy' signal to reduce the number of collisions at digipeater receivers. The packet repeater with a busy signal will, like a duplex repeater, use two frequencies. Whenever it is receiving a packet, it will transmit a busy signal on its transmit frequency. This signal will be recognized by stations using the repeater, and they will not transmit when they hear the busy signal. Once a packet has been completely received by the repeater, it will be regenerated (as in a digipeater) and retransmitted. The repeater with busy signal is addressed just like a digipeater. This addressing and the regeneration of packets before they are

repeated may make the proposed system superior to a standard duplex repeater. WB6VAC will be experimenting to find out if the system works well.

"We are working on expanding our network into Oregon, which is where we will meet WESTNET. A site in Longview, Washington, has been located, and we are working to put in a digipeater there. Longview 'sees' Portland, Oregon. The Utah Packet Radio Association (UPRA) and the Boise, Idaho, group are working to connect with us through the Pullman, Washington/Moscow, Idaho area. South-central Washington should be on the air later this summer. We also hope to work with VADCG to get a true Gateway into their 145.65-MHz network, which uses the V-2 protocol."

Via HAMNET.

PACKET FOR THE COMMODORE 64

The manufacturer of the PKT-1, Advanced Electronics Applications (AEA) will be announcing a packet-radio adapter for the C 64 sometime this fall. The adapter will plug into the C 64 like any other program cartridge, and it will provide AX.25 protocol software, a terminal emulator program and a modem. Transmission and reception of HDLC frames will be handled by hardware. To provide enhanced HF operation, AEA may use something other than the common EXAR IC modem. How much will it cost? Around $200, but the price has not been set yet. When will it be available? This fall, probably sometime in September.

Via WB9FLW, AEA.

TAPR PROJECT STATUS

The TAPR TNC 2 is in the "final stages" of beta testing, with the hardware completely debugged and the final version of the software distributed to the dozen beta testers. The manual, one of the most demanding aspects of the project, is almost complete. It looks like initial estimates of "late summer or early fall" for availability of the first 300 TNCs were fairly accurate. The process of announcing the availability of the TNC 2 and then taking orders for it will be tightly controlled. When TAPR is ready to take orders, electronic messages will be posted on DRNET and Compuserve HAMNET. Orders will be taken over the telephone, and only one order per person and one order per phone call will be accepted. No COD or purchase orders will be accepted. Once the first 300 TNCs have sold out, there will be NO WAITING LIST. These rules will not be bent.

The TAPR PC board for the K9NG 9600-bit/s modem is also just about through beta testing. Several of the boards in operation at beta sites.

a reasonable price ($459 mail order). Recient messages about ICOM and Yaesu FRG-8800 battery backed-up RAM containing REQUIRED operating parameters have me worried. Does anyone have first-hand knowledge if this is the case with the FRG-9600? Planned obsolescence (or required maintenance, if the company will be willing to do it into the distant future) is not a desirable feature in a receiver. BTW, the Kenwood R-2000 does not have this problem.

Is there any reason that a good quality, 25 element UHF/VHF/FM television antenna on a rotor wouldn't be as good or better than a "scanner" antenna? The frequency coverage is about the same, it is directional, and the antenna feed is low loss 75 ohm coax. I am aware that impedance matching would be necessary if the scanner input is not 75 ohms.

Finally, thanks to Bob Parnass for his recient review of scanner features, specifications, and their operation. It was most helpful to those of us trying to figure out what's out there, and what features are important.

> The squelch tail occurs because the AGC gain opens up faster than the
> squelch closes.

You're forgetting that FM is a nonlinear modulation method. An ideal

discriminator reads signal PHASE and is completely insensitive to RF level. Moreover, there is limiting ahead of the discriminator, so the "gain" in an FM receiver up to this point depends instantaneously on the signal level. When the input signal to an "ideal" FM receiver goes away, the pre-discriminator gain instantaneously goes to infinity. (In a real receiver, it goes just high enough for front-end thermal noise to saturate the limiters). Thus, you have squelch noise that starts immediately upon loss of signal.

The AGC is there just as an engineering convenience to keep the front-end intermod products down when receiving a very strong signal. It plays no part in keeping the audio output level constant, as it does in linear modulation reception such as SSB.

Phil

Don't miss the BIG EVENT of the summer for Ham Radio in New England!!!

The H E A V Y H I T T E R S H A M F E S T and F L E A M A R K E T will H A P P E N (as in a Happening!) on Saturday, 20 July and Sunday, 21 July, 1985, at the famed TOPSFIELD FAIR GROUNDS, near the U.S. Route 1 exit from Route 95 in Topsfield, MA.

That is THIS COMING WEEKEND !!!! Pack your bags, fill your wallet with nice crisp green money, and rent yourself a BIG TRUCK to haul all the good stuff you are gonna be able to buy at TOPSFIELD!

In addition to a massive FLEA MARKET, there will be COMMERCIAL EXHIBITORS who will be showing the latest and greatest in the big name lines of Ham equipment. Exhibits will be open from 9 to 4 both days. The Flea Market will be outdoors and will doubtless be open much earlier than 9:00, so get there early! (NOTE: Flea Market sellers will be admitted at 6 AM Saturday. ALL

VENDORS, both commercial and Flea Market, will be assessed a $5 fee be the town of Topsfield.)

There will be a real, live FCC LICENSE EXAMINATION, conducted by those cute Volunteer Examiners you've been hearing about. (Well, maybe you haven't heard...) NOTE: Walk-ins will be accomodated insofar as possible, but to be safe you should TRY to bring your own FCC Form 610. If you can't get one, we understand that one of Boston's most successful FORGERS will be there to make up custom copies at special Flea Market rates. Inquire about rates on other useful documents and certificates as well, available by special appointment only.

NOTE: The FCC Exams will be held not at the Fairgrounds, but nearby at the MASCONOMET REGIONAL HIGH SCHOOL near the Endicott Road exit off Route 95.

As if that weren't enough, the masterminds of the HEAVY HITTERS HAMFEST are planning also a series of AMATEUR RADIO FORUMS on Saturday afternoon, with sessions on Packet Radio, Amateur TV, AMSAT, the Amateur Satellite Corporation, and on ARRL Activities. Representatives of the League will be present to talk with you personally.

There will also be several exciting CONTESTS including a QSL contest, hidden transmitter and HIDDEN RECEIVER (!No Kidding!) hunts, a CW copying contest that will include real live QRM, and much more.

A Saturday night musical Coffee House is planned, as are a number of other events of interest to non-hams.

There are probably even a few crazies out there who will arrive Friday night and avail themselves of the excellent CAMPING FACILITIES at Topsfield. The flea market opens early, I mean EARLY!!!, so camping on the doorstep is not an extreme measure if you want a chance at the BARGAINS before they are all gone!

Admission is $4.00 at the door, and spouses (spice?) and kids are free; in fact I think the rules read that any non-ham guests are admitted free. Proceeds from the Hamfest will support the Waltham (open) Repeater and several very worthwhile charities, details available at the Hamfest. Talk-in will be provided on the Waltham repeater, 146.04/64 MHz, and on the Topsfield machine on 147.885/285. So you don't even need a road map, if you can find your way to Boston!

Come one, come all! This is THE BIG ONE, the one you DON'T WANT TO MISS !!! See you THIS SATURDAY at TOPSFIELD FAIR GROUNDS. Shucks, I might even be operating the Talk-in Station myself on Saturday! I would be pleased to meet all my ARPANET/USENET friends out there in Baud Land (like Radio Land only different) ! I hope to see you there!

>Does anyone out there know what the going rate on the used market is for
>the following equipment:
>
>   Heath Apache (TX-1), Mohawk (RX-1), and SB-10 SSB adapter

Heath Apache w/o SSB adapter: $10. (Post at your local marina.)

Apache with SSB adapter: $150 - $225. (Prices seen at recent hamfest.)

SSB adapter w/o Apache: $150 - $225. (Find some Apache owner without SSB.)

Suggestion: try to get what you can for the SSB adapter, then donate the
Apache to a school or ham club. I owned an Apache for years and know that
there are more Apache's than SSB adapters out there!

Subject: Re: "PL" and tweedles
In-reply-to: Your message of Thursday, 11 Jul 1985 20:25-EDT.
<204@redwood.UUCP>

Mr. Warnock's solution to the squelch tail problem would probably work if the modulation method were AM rather than FM.

However, a well-designed FM receiver pays little attention to the amplitude of the signal being processed, insofar as the audio output level is concerned. Specifically, the discriminator output is ideally the time derivative of the instantaneous phase of the IF signal output, and changing the gain of the IF chain has no theoretical effect on this parameter.

As a matter of fact, it IS possible to make squelch circuits which turn off considerably faster than the typical ones you hear. It is also possible to insert a time delay network, e.g. using "bucket brigade" chips, in the audio path, so that the squelch circuit can in effect turn off before the signal does! Quite a few "ham" repeaters do precisely this to avoid the "double squelch tail" effect of a repeater. (They haven't figured out how to get rid of the one generated by YOUR receiver, though!)

Back when I was in the Applied Research Labs at Motorola in ought sixty five or so, they had worked out a squelch that gave only the barest little "tick" when the signal went off, and they thought it was the greatest thing since sliced bread, or whatever. Then the marketing guys went out and found out that the customers, mostly police departments and trucking fleets and such, didn't WANT the squelch tail removed. Maybe they thought it was sort of "macho-radio" to hear that deafening burst of noise at the end of each transmission, or maybe they just thought it was a nice, handy, functional feature to have a distinctive end-of-transmission indicator, but in any case, they wanted their old squelch tail back. So the idea died right then and there. The guy who invented it threw in the towel and went into patent law instead of trying to invent things anymore. He also applied what he had learned about signal detection theory, so he told me, to his dealings in the commodities market, and got rich with his little squelch detector turned into a "buy! buy! buy!" detector! S'truth, s'help me!

The MIT Radio Society and UHF Repeater Association will conduct
a volunteer exam session for all classes of amateur license.
The session will take place on Wednesday, July 24 at 7:00 pm.
Address: 77 Massachusetts Avenue, Cambridge, MA, MIT Room 1-134.
Please bring with you: a completed FCC form 610 (available from
the FCC), the $4.00 exam fee in cash, and a copy of any amateur
license you currently hold. Also required will be two forms of
identification. Please contact Ron Hoffmann, WA2EYC at either
(617) 253-5820 or (617) 646-1641 no later than Monday, July 22
if you are planning to attend. A limited number of walk-in
candidates will be accepted, space permitting. This is a W5YI-
VEC session. via WA2EYC

One correction to that article on cellular is that you can hear both sides
of the conversation on one frequency. There is sidetone in the system and

if you monitor the cell xmit frequency, you will hear both sides.

Here at the hospital we have a lot of VHF and UHF "walkman" sized EKG transmitters that patients walk around with. As a quick performance check for these units, I would like to add a circuit to a decent scanner such as the Regency MX5000 to use it as a tunable relative field strength meter. Such a tunable device would also come in handy tracking down sources of problem RF as we sometimes have. Any suggestions as to where in the scanner to tap a signal and what kind of simple circuit I can use would be appreciated. I was thinking of using an analog meter movement as a visual indicator. All I am interested in is relative carrier signal strength. Any help is greatly appreciated.

I am looking for a communications receiver with the following
characteristics:

AM & FM broadcast bands, plus some VHF band (30-50 MHz, or 144-180 MHz)
OR UHF band (450-512 MHz), plus the aircraft band (~116 MHz),
with analog tuning (a knob, not a keypad) and digital freq display.

Memories, scanning, clock, etc are not essential.
AM short wave (10kHz-30MHz) is NOT needed.

The Sony 2002 lacks analog tuning, VHF and AIR.
The Sony 2010 lacks VHF/UHF.

Thanks for any leads.

Actually, the sidetone is generated in the mobile unit. You might be able to hear the mobile-originated side of the conversation by listening in on the cell site, but that would be due to crosstalk in the switch and would probably be at least 10 dB down.

New Uniden Bearcat 800XLT Scanner To Include 800 MHz Band

Uniden will soon introduce the 800XLT, a new 40 channel 12 band scanner that includes the 806 - 912 MHz range. What follows is a description extracted from the information provided me by a Uniden employee.

A keyboard will be used to program 40 channels in 2 banks for the following frequency coverage:

Freq Limits (MHz)	
Lower	Upper
29.7	54
118	136
136	174
406	512
806	912

An instant weather feature, activated by depressing the 'WX' key will cause the scanner to search all the NOAA weather radio frequencies for a weather station in the area.

A priority channel feature will be provided that samples channel one every 3 seconds, whereas previous Bearcat models sampled every 2 seconds.

A 3 second scan delay will be selectable on a per-channel basis, as compared with 2 second delay on older models. Channel lockout will apparently be of the conventional variety, as will be the direct channel access

capability (not available on most new Regency scanners).

Scan rate will be specified at a respectable 15 channels/second. The 800XLT will incorporate a full vacuum fluorescent decimal frequency display and can be powered from 117 VAC or 12 VDC. Two telescoping antennas will be supplied, one being for 800 MHz.

From looking at the picture I have, the scanner will be dark gray, with silver trim around the sloping front panel and look like a cross between the BC300 and the BC210XL.

Bob Horvitz, a shortwave listener 'par excellence', and chairman of ANARC's Over-the-Horizon Radar Committee, asked me to post the following information. [I in no way endorse or warrant any offer contained herein, but post it for information only. Don't respond to me, respond to the address in Washington, DC.]

THE WOODPECKER PROJECT

Coordinated by the
Association of North American Radio Clubs'
Over-the-Horizon Radar Committee

1634 - 15th St. NW
Washington, DC 20009
USA

Purpose: To gather current data on the worldwide interference caused to shortwave broadcasters and their audiences by the high-power pulse emission sources known colloquially as the "Woodpeckers". This data will be analyzed and presented to telecommunications ministries of countries participating in the 1987 World Administrative Radio Conference for High-Frequency Broadcasting, in an effort to convince them to support a protocol statement condemning this interference.

Data needed:

1. In order to map the "Woodpeckers'" general band use, we need large numbers of volunteers to monitor parts of the spectrum between 5 and 23 MHz for 3-hour periods during October 1985. If each monitor covers 3 MHz, and at least 3 geographically-separated monitors are scheduled for each time and band segment, then at least 144 monitors are needed for 24-hour coverage. We would like to gather 5 days worth of data. That requires at least 720 volunteers. Attached to this sheet is a sign-up form. Please fill it out, indicating what times you can commit to monitoring. Return it without delay - in any event, before 15 August 1985. We especially need people able to monitor at unusual times (just before dawn, for example). Our monitoring report form is a simple graphic system requiring minimal effort to complete.

2. We also seek reports of specific instances of "Woodpecker" interference to stations operating in the shortwave broadcast bands. Reports should include the name of the affected station, its frequency, the date and time, duration and relative strength of the interference, the type of receiver, and your location. Mail us your reports before 1 November 1985.

Recognizing "Woodpecker" signals: They're called "Woodpeckers" because that's what they sound like on a shortwave radio. Technically, the signal is a 3 millisecond square-wave pulse with a stable pulse rate of 10/second. (Rates of 17 and 7.4/second have also been heard, but rarely.) The signal is wide band, with most of the energy concentrated in about 15 kHz, and a weaker "pulse-scape" filling the adjacent spectrum. The energy concentrations can be clustered together to cover 100 kHz or more. The "Woodpeckers" change frequency abruptly and often. Their "dwell time" varies

from a few seconds to a few minutes.

Money: This project is organized and staffed entirely by unpaid volunteers. We need your help to pay for printing, postage, etc. To raise money we are selling T-shirts with our symbol [a woodpecker in a circle with a red slash over it - BP], for $10 each postpaid in North America. Arrangements for foreign distribution are still being explored. When ordering, please specify size (S/M/L), and make checks payable to "The Woodpecker Project" in US currency.

Additional copies of this announcement are available for 1 uncanceled 1st class US postage stamp + a US stamped self addressed envelope; or 3 IRCs. We also encourage you to photocopy and distribute these sheets yourself.

X=======================CUT HERE============================X

Sign-Up for the Woodpecker Monitoring Team

Name:_____ Years of SW listening experience:_____

Address:_____ Receiver model:_____

_____ Receiver's band coverage:_____

_____ _____

In the table that follows, put a "1" in the box that corresponds to the date/time which is your first choice for duty, "2" for your second choice, etc.

If you are willing to monitor for more than 3 hours, how many time periods can you handle?_____

We will try to schedule you according to your preferences, but we can accommodate only 48 monitors per time slot, and ther factors - like geographical distribution - must be considered, too. In general, our policy is "first come, first served", so don't delay! Send this completed form - along with a self addressed US-stamped envelope, or 3 IRCSs to:

The Woodpecker Project
1634 - 15th St. NW
Washington, DC 20009 USA

We must hear from you by 15 August 1985. Time and band assignments will be mailed out 1 September 1985.

Feel free to photocopy and distribute these forms to other SW listeners.

X=======================CUT HERE============================X

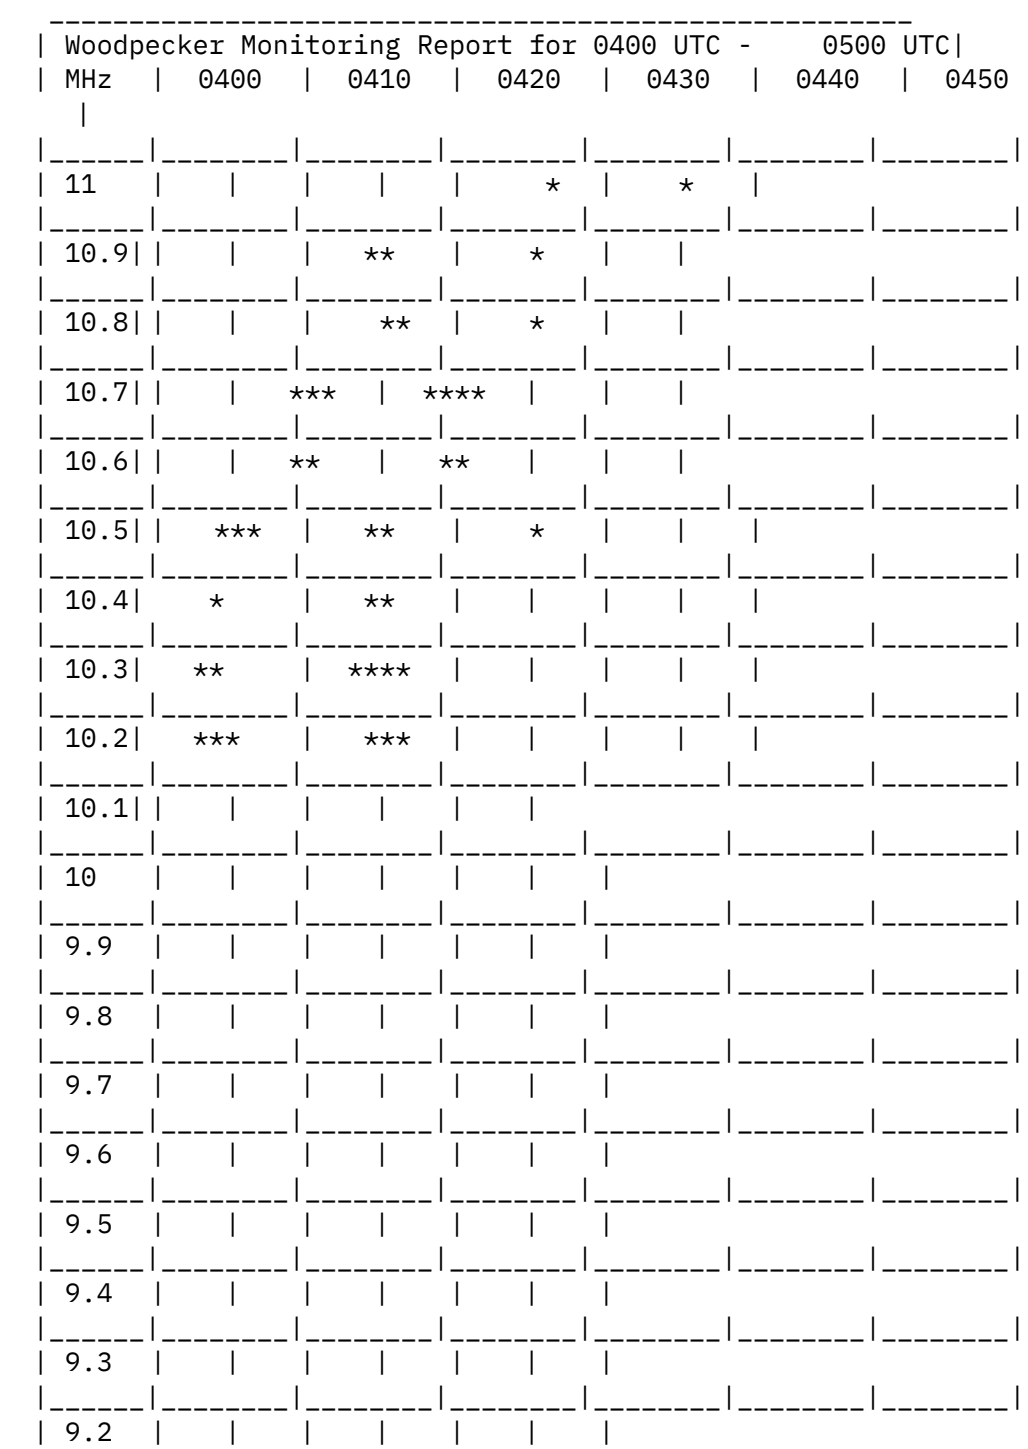
Monitoring Report - The Woodpecker Project

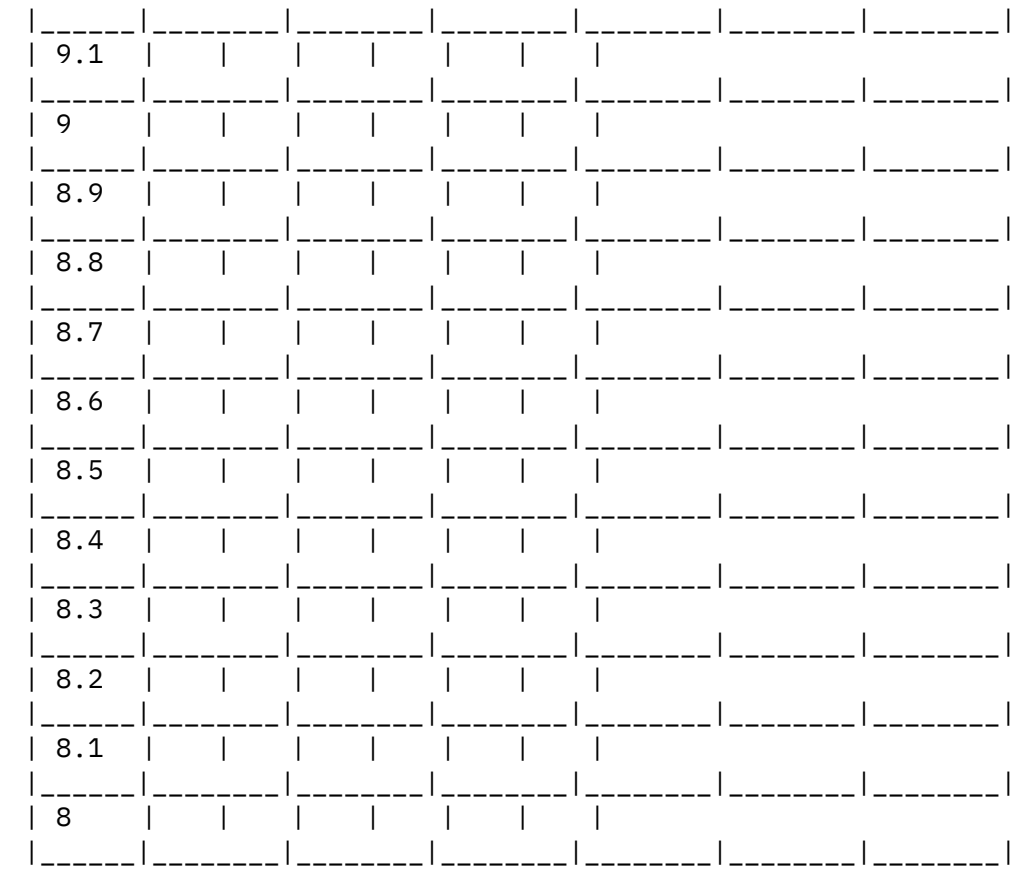
Instructions: You are to monitor a 3 MHz portion of the shortwave spectrum for 3 hours (the table below shows only 1 hour for brevity, your chart should be 3 times wider). Sweep your assigned band however you like, so long as you TUNE EVERY FREQUENCY AT LEAST ONCE EVERY 10 MINUTES. Whenever you hear a "Woodpecker", put a small distinct ink-dot on the grid to mark the frequency and time. If your monitoring is interrupted, note this by drawing vertical lines on the grid to show the time missed. Label the area between the lines "UNMONITORED". (For obvious reasons, please try to avoid interruptions.) Thanks for contributing your time and effort to this project. Even if you don't hear the "Woodpecker" during your sweeps, remember that

that, too, is valuable information. Please return this form
by 1 November 1985 to:

The Woodpecker Project
1634 15th St. NW
Washington, DC 20009, USA

Sample Monitoring Report
(only 1 hour shown for brevity)





Please use the back of this form to record additional obser-
vations and comments.

Date:_____ Monitor Name:_____

History-- About a month ago Clifford@mit-eddie posted an article in net.ham-radio which among other things told of the Arpa mailing list "packet-radio". Several packeteers in my local area were interested in reading the list. A brief discussion in newsgroup "net.ham-radio" discussed the possibility of gatewaying the "packet-radio" list into "net.ham-radio". However, the Arpa list "info-hams" is already exchanged with "net.ham-radio".

There are good reasons to keep the two separate. About three weeks ago, I posted an article asking for comments on the proposal to create "net.ham-radio.packet" as a subgroup and connect it with the "packet-

radio" list. In that article I indicated I would create the group after a suitable waiting period if no one objected. Unfortunately, at the time mtunh was having some news distribution problems. Among other things, the proposal did not make it to "net.news.group". In fact, it might not have made it very far off mtunh at all, even in "net.ham-radio".

Last week, based on no negative replies and several positive ones, I created the "net.ham-radio.packet" group. I have received several flames since then.

Explanation/Apology-- I was not trying to make a decision and force it on the entire net! I am not a newcomer to Usenet (In fact, I created "net.ham-radio" in the first place over 4 years ago!), and know the net procedures. I am sorry that we had news distribution problems here.

Solution-- So, let's try again ... Other than the flames on procedural issues, does anyone have any real problems with the creation of net.ham-radio.packet? I am already on the mailing list and am getting the info, but several others around here would like to read it too. I did get several positive replies (from those who saw my first posting). It seems (to me) that there is sufficient interest for a newsgroup and it should be a subgroup under net.ham-radio. I guess at this point the new group exists on some sites, but I know from the flames that others have removed it. Let's get the useless exchange on proper etiquitte etc. over with and get to the technical content of packet radio.

What say? Let's shoot for a JUly 15 decision of "net.ham-radio.packet" -- to be or not to be???

As a burnt out ham coming back to the fold, I need some info:

I want to upgrade my Tech license to a General.

Where do I get a code test in the Chicago area? I'm told
the FCC no longer does it. I've been gone several years now
after my 2 meter rig was stolen.

Also is it true the code test is "comprehension" only?
What does that mean concretely?

    Thanks,

          ihnp4!ihlpg!berman

Anyone interested in playing chess via amateur
radio ? Propagation isn't so hot these days, but
80 meters seems pretty reliable in the evenings, at
least for the West Coast.

I'm located in Sherwood, OR (20 miles south of Portland)
operating at 100 watts with a multiband vertical. The
vertical has a rather narrow freq. response, especially on
80 (3850 is the current minimum SWR).

It seems like a good way to combine two hobbies.

NI7M Bruce Cheney

Here's one vote YES; create net.ham-radio.packet for the discussion of
amateur packet radio and gateway to the packet-radio@mit-eddie mailing
list. Let's get this done and over with.

Poor Jim! He tries to do it "by the rules" and what happens...
Murphy Strikes!! I hope this time the "word" gets sent to all
sites in the prescribed manner.

Anyway...

>Solution-- So, let's try again ... Other than the flames on procedural
>issues, does anyone have any real problems with the creation of
>net.ham-radio.packet? I am already on the mailing list and am getting
>the info, but several others around here would like to read it too. I
>did get several positive replies (from those who saw my first posting).
>It seems (to me) that there is sufficient interest for a newsgroup and
>it should be a subgroup under net.ham-radio. I guess at this point the
>new group exists on some sites, but I know from the flames that others
>have removed it.

>Jim Kutsch ihnp4!mtunh!jak or ihnp4!mtunh!ky2d!jak
>ATTIS Holmdel, NJ (201) 834-2092

My site (akgua) did not remove the new newsgroup. I am all for it!

The fact that it needs to be a separate newsgroup for ARPA and/or
mailing list gatewaying gives it even more reason for existance.
And from what I have seen and heard to date, it is a growing topic.
However, the non-packeteers who avidly read net.ham-radio would
appreciate not being deluged by packet-related articles.

Cheers,
  Lindsay

BACKSCATTER Newsletter

Just received an issue of BACKSCATTER, a sporadic newsletter "designed to inform the shortwave community about developments in the field of Over-the-Horizon (OTH) Radar." Bob Horvitz, chairman of ANARC's Over-the-Horizon Radar Committee, edits BACKSCATTER, which is about 4 pages long.

According to the issue I have, one may receive the next issue of BACKSCATTER when published by sending a long, self-addressed US-stamped envelope and 50 cents (for a single issue.) The 50 cents may be in the form of mint US postage stamps. Requests for delivery to points outside the US should not include SASEs or foreign stamps, but 4 IRCs for airmail delivery instead.

Address inquiries to:

Association of North American Radio Clubs'
Over-the-Horizon Radar Committee
1634 15th St. NW
Washington, DC 20009 USA

The June 1985 issue contains these articles, as quoted from the 'News in Brief' overview:

- "Woodpecker Project" gathering data on Woodpecker band use and interference to shortwave broadcasts; hundreds of volunteers needed for world-wide monitoring effort in October.

- First 60 degree sector of US system in Maine to begin test transmissions this summer or fall.

- England and Japan may get OTH radars.

- Debate over OTH procurement within Pentagon shar-
  pens as DARPA chief says, "we cannot afford to use
  contemporary technology to build a US
 air
  defense... space systems are the only way..."

- More detail on Australia's "Project Jindalee":
  contrary to earlier reports, it's not a pulser.

- OTH and the "Star Wars" connection.

Summary:

If you want to create a newsgroup to act as a "gateway" to and from
an Arpa newslist, the newsgroup should be created as a "mod" group, not
as a "net" group. The "mod" option will help get replies to the
right place (as well as postings) and make the gateway simpler
to maintain.

We DON'T want another "net" group which connects to an Arpa group.
We've had problems with such links in the past.

The only suggestion I have to offer is that you name it
    net.radio.packet
or
    net.hr.packet
instead. The reason is that, for people that run notes, a directory
is created with the name of the group used as the the name of the directory.
On non-4.2 BSD systems, the limit the length that a directory name can
be is 14 characters. net.ham-radio.packet exceeds that limit at the
second period. Thus, the proposed group will get truncated to
"net.ham-radio." Could you please use a name that is <= 14?

From June 1985 BACKSCATTER, newsletter of the Association of North American Radio Clubs' (ANARC) Over-the-Horizon Radar Committee:

MAINE RADAR TO START UP SOON

"Test transmissions from the first sector of the US Air Force's OTH radar in Maine are expected to start this summer or fall. Listen for loud buzz-chirps with bandwidths of 5, 10, 20 or 40 kHz. When the bandwidth is 5 or 10 kHz, the waveform repetition rate should be 10 to 20/second; when it's 20 or 40 kHz, 20 to 60/second."

"The experimental OTH radar was authorized to transmit in these bands, according to QST (April 80):"

Bands Authorized (kHz) for 1985 USAF OTH Radar Experiment		
6765-7000	10100-11175	17360-17900
7300-7508.4	11400-12330	18030-19993
7530-8195	13360-14000	20010-21000
9040-9995	14350-14993	21450-21850
15100-16460		

"Bands used by the operational radar may be different. It will also be capable of transmitting in the 5000-6740 and 22250-30600 bands, but will probably be restricted to only portions of the added spectrum. In general, look for it in the Fixed bands."

Do WHAT? I don't remember the original posting but I would imagine the
RAM is used to store transient information such as station presets and
perhaps volume settings. A ROM? be serious, you can have any color you
like so long as it's blue, and volume you want so long as it's 5 any
station you want if you can get them to move to 101.2 :-)

We (those involved) do not want a "mod." group. We have had net.ham-radio for years and have been successful in exchanging news with the ARpa info-hams list. All we want to do is create a subdivision.

I do not understand why this is of such interest to all those who don't read net.ham-radio in the first place!!! We have subdivisions under net.religion, net.nlang and several others. If you really want me to do it I can post numerous private mail messages in support of the net.ham-radio.packet group. Is this really necessary? The idea here is just a subdivision of an existing group to better serve those who are involved in the group.

Also, Mr. Spafford, I answered your (somewhat presumptuous) private mail to me when you did the rmgroup. However, I have not seen a reply. I guess you would rather have all net folks read our correspondence? Rhetorical question: why does *EVERYTHING* on Usenet have to generate 50Kb of net traffic before anything can be done? The overhead of discussing procedural issues seems to almost exceed the real traffic in some cases!

Cheers, Jim

There seems to be a slight misunderstanding here. There are two types
of battery backup. The first is just a battery backup of RAM for
storage of your "memory" channels or your frequently used operating
parameters. Big deal if that goes dead. You replace the battery and
just reprogram your memory. The problem is some new equipment is
designed so that a number of units use the same board and the unit is
programmed "on the fly" on the production line and an on board battery
keeps it alive. The problem is that if you loose the battery, you loose
everything, including the ability to reprogram. This means a return to
the factory, and a bill.

Check the June 1985 issue of QST for an article on vertical antennas. The article describes the effect of the number of radials, soil conductivity, length of radials, angle of radiation etc. Maybe it will give you some ideas. Let me know how you like it as I am interested in possibly getting one myself.

Unfortunately, there really are wear-out mechanisms even in semiconductors. They are less obvious than the ones in tubes, but no less real.

Plastic IC packages (used for most ICs in commercial equipment) are not hermetically sealed, and may eventually develop leaks that let air and moisture at the chip; the resulting corrosion kills it. Why do you think the military uses ceramic (truly hermetic) packages almost exclusively?

Diffusion does occur even in solids. Various forms of material migration can occur in the presence of electric currents. These things are significant concerns to semiconductor manufacturers. Remember that commercial ICs are optimized for low cost rather than ultimate maximum lifetime.

Power spikes, static, and similar forms of overstressing may possibly account for a significant fraction of semiconductor failures in the field. It is very difficult to shield completely against such things, although "99%" protection is much easier and increasingly common. Note that power

behavior during powerup and powerdown is rather ill-specified and hard
to control completely.

EPROMs and EEPROMs inherently have limited lifetimes if they are being
reprogrammed regularly, because the erase/program techniques involve
pushing electrons through materials that are normally insulators. The
technique used to do this is basically brute force. This unavoidably
involves some degradation of the insulator. Do it too many times, and
it won't insulate any more.

EPROMs and EEPROMs will *eventually* lose their contents anyway, because
they rely on holding charge on very-well-insulated electrodes. Although
the insulation around those electrodes is of truly superb quality, it's
not perfect, and the charge will leak off eventually. In the absence of
unusual stress, this takes a very long time. Nobody is quite sure how
long, because we haven't had the devices that long! Extrapolations from
stress tests may not be 100% valid, although they do give hints.

Circuit designs which use batteries for volatile memories simply need
their batteries replaced occasionally. They don't "become useless"
any more than a flashlight becomes useless, although in some cases the
battery replacement may be a lot of hassle. (When expected battery
lifetime exceeds expected equipment lifetime, it's tempting to just
solder the battery in.)

Things like semiconductor lasers in CD players are being operated "hard
and hot"; this aggravates failure mechanisms like material migration
and solid diffusion. Often there is a deliberate tradeoff between power
output and lifetime, as with incandescent bulbs. For example, stadium
lighting is often run at higher-than-normal voltages; the bulbs burn out
quickly but yield a lot more light meanwhile, and this is a reasonable
tradeoff in that application. Similarly, commercial semiconductor lasers
have very limited power outputs because of difficult technical problems.
Getting the necessary power with available components may *require* some
deliberate loss of lifetime. Even when higher-power components really are
available, it may be a good deal cheaper to opt for shorter life. (Just
how much extra are most consumers willing to pay for long-life components?
Regular incandescent bulbs heavily outsell long-life bulbs, remember.)

> This troubles me. I had thought that we had a reasonable progression of
> development of electronics during these days of solid-state gear
> replacing tube equipment that meant longer life for any device. ...

Longer, yes. But not infinite. Not even the phone company's highly
conservative, heavily over-engineered equipment is expected to last more
than 40-50 years (and this is *not* a zero-maintenance lifetime, either).

> But now I see that designers either deliberately build in inevitable
> failures (the use of volatile ROMs and batteries instead of PROMs or
> other permanent devices) or the solid-state stuff I was led to believe
> had indefinitely-long lives really is as short-lived as vacuum tubes
> (the laser diodes mentioned above).

You pays your money and you takes your choice. If you are willing to
pay double or triple current prices, you could probably get some very
long-lived equipment. (The high cost of military electronics is not
all corruption and overcharging.) (95%, maybe.)

> I may be insane, but I really expect electronic equipment to operate
> forever. I don't want to buy any that has built-in and inevitable
> failure. ...
> I realize that consumer products have built-in planned obsolescence.
> I'm not talking about small appliances, which I expect to die and be
> replaced. I'm talking about multi-hundred-dollar equipment. Am I
> totally unjustified in expecting such things to be designed to
> continue to work indefinitely without maintenance, except for
> mechanical stuff like motors, belts, pots, etc?

Basically, yes. There ain't no way to make it work indefinitely. And
making it work "a long time" is quite expensive. Semiconductors have
made it relatively easy to build gear with far longer lifetimes than
tube equipment, but this is a (large) quantitative improvement rather
than a fundamental repeal of the Second Law of Thermodynamics.

THe last Field Day that I participated in where I was responsible
for setting up the 75/160 meter station, I decided to use a vertical.
I used a center loaded pipe about 35 to 40 feet high. The antenna
was tuned slightly too low in frequency for 75 so I compensated for
that with a series cap at the base. On 160, I added additional coil
to lower the frequency. The ground system consisted of eight quarter-
wave radials on 75 meters. The system worked really great on both

bands, in fact better than expected. On 160, we worked all stations
we could hear on that band in 30 minutes (there were only about 25
stations on). By the way, the base impedance, as expected, was less
than 50 ohms so a toroidal autotransformer was used to match it to the
coax. No tuner was used on the 820 transciever. The radials were
insulated stranded wire, about 18 Ga.

thank you Bob Parnass for all of the interesting frequency listings. Keep
'em coming. By the way where do you FIND all of these frequencies???
Postings of any other listings anyone else has are also appreciated.

I watched the launch of Discovery on a TVRO system this morning, and
I must say it was a refreshing change from trying to sort out the junk
the network newscasters clog up the airways with.

If you have been looking for the sat info, I caught the NASA link on
Satcom F1R (F1 in most sat mags) on transponder 18. F1 is in geosync
over 139 W longitude. A different magazine showed the NASA link to be
on Galaxy G1 (the next sat west of F1) on transponder 13. I didn't try
to confirm this as G1 comes in very poorly on a 7 ft dish from central
Indiana, and I was also trying to video tape the launch.

For those of you with HF ham radio low band gear or a shortwave
receiver, the Goddard Amateur Radio Club in Greenbelt, MD is again
retransmitting the shuttle audio on 3.860, 7.185, and 14.290 MHz.

qst de k9eui
hr propagation forecast bulletin nr 24 from arrl headquarters
newington ct june 16, 1985
to all radio amateurs bt

as discussed in last weeks bulletin, the solar flux curve is beginning another downward trend. numbers have been close to those of 27 to 28 days ago except that since june 11th the decline has been more rapid. the flux number for june 16 was 78, ten points below that for may 19, when the sun was in a similar position with respect to the earth. flux values near the quiet sun level are expected in the last few days of june.

the effects of lower solar activity are minor in the summer months. skip tends to be longer on the lower amateur bands as solar activity declines. on 21, 28 and 50 mhz the early summer sporadic e ionization produces almost daily short skip, over 400 to 1300 miles, depending on the band and on the ionization density. the latter reaches its peak in late june and early july. watch 144 mhz for e skip opportunities this season.

the lower solar activity currently makes for less disturbance of the earths magnetic field, and this is good for nearly all amateur communications over other than local distances. undoubtedly, summer is the season for increased thunderstorm activity, and higher noise levels are observed on all frequencies much of the time. storm noise can be propagated over long distances on the lower frequencies. storm static is essentially a local phenomenon on frequencies above the muf at the time.

american sunspot numbers for june 6 through june 12 were between 31 and 59 with a mean of 40.3 ar

Gene, get off it. Perhaps you would volunteer to moderate this list?
Perhaps you'd like to moderate all the net groups so that problems
won't occur? The gateway is very simple to maintain. All we do is

some table entries and it occurs. What basis in fact do you have for
your statement?

-Ron

A quick question from a rusty "re-licensee":

   When a DX station calls CQ DX, is he willing to accept stateside
   replys? When W2XXX calls CQ DX I know he doesn't want to hear from
   me. But when OK1XX calls CQ DX does that mean he doesn't want to be
   called by other Czechs or not be bothered by the stateside throngs.

                                    Tnx - Jim (NJ2F)

dx bulletin nr 23 from arrl headquarters newington ct
june 14 1985 to all radio amateurs bt

china. dk7pe has been active from by1qh on 14025 khz at 12z, on 40 meters at 13z, and occasionally on 14227 khz at 14z. he should be active through this week.

iraq. yi1bgd has been active on 14210 khz at 19z.

faroes. oz5dl/oy and oz5ul/oy have been active on 14200 khz at 2150z, 7002 khz at 0245z, and 14033 khz at 2230z. qsl via home callsigns.

taiwan. bv2b has been on 14205 khz at 1330z.

djibouti. j28ei has been active on 14022 khz and on 7002 khz at about 0230z. qsl direct.

sudan. dl5kl/st2 has been active on 14334 khz at 16z.

sao tome. s92lb has been heard on 14186 khz at 2030z, working into europe.

togo. 5v7hl has been on 14220 khz at 2110z.

pakistan. ap2nq and ap2au have been active on 14185 khz between 0100 and 0230z.

mauritius. 3b8cs has been active on 40 meters. he is hoping to operate from 3b6 or 3b7, possibly in early july if he can get the paperwork problems solved.

rwanda. 9x5wp has been active on 14105 khz at 0430z. qsls go via wb6ckd. ar

In article <460@mtunh.UUCP> jak@mtunh.UUCP (Jim Kutsch) writes:
>I do not understand why this is of such interest to all those who don't
>read net.ham-radio in the first place!!!
>
>Rhetorical question: why does *EVERYTHING* on Usenet have to generate
>50Kb of net traffic before anything can be done?

I understand the meaning of "rhetorical", but these points deserve to be
explained for those on the net who are in Jim's position of not understanding
how Usenet works. The reason why many of us who do not read net.ham-radio
are interested in new newsgroups is that many of us have to administer
netnews on our machines, and in some cases hold the net together with spit
and bailing wire. If people went off and created newsgroups on a whim,
utter confusion would result (even more than already exists). There is
a procedure established for creation of new newsgroups (yes, even just
sub-divisions, remember that net.ham-radio is "just a sub-division" of net.)
which is documented in articles posted to net.announce.newusers. If
someone doesn't like the procedure, then s/he should work to change it,
but it should still be followed in the mean time. If you read the procedure,
you will see that if the procedure had been followed by all concerned, that
the traffic generated would have been at most A) a solicitation of interest,
B) some direct mail traffic, C) an announcement of results, and D) a newgroup
message. That really isn't much. Ok, now let's all re-read (for the first
time?) the messages in net.announce.newusers and not post anything else until
we have. If someone doesn't get that newsgroup, contact your netnews admin.
If you are the netnews admin and don't know how to fix it, let me know. Thanks.

Hi,

I've been monitoring the public service airwaves (police, fire, etc) here in Silicon Valley for quite a while. I am wondering if anyone knows what the verbal codes being used mean. Not just the ten-codes but the letter suffixes and the other codes.

e.g.; 10-98G, 10-8N, 10-98X etc.

It seems like the letters are some type of case disposition code, but what does it mean?
I would appreciate any info anyone might have on this subject. This may not be appropriate to post to the 'world' but who knows, there are a lot of listeners out there.

Judging from the direction this discussion has been taking, I think
the point of the original note was lost. I don't think any of us
object to batteries being used in radios and the like to store
transient information. What's being objected to here is the use
of a battery-powered CMOS RAM _i_n_ _p_l_a_c_e_ _o_f a ROM for storing
the "permanent" part of the controller's memory.

In particular, Icom markets a series of radios with this sort of device.
The IC-R71A receiver, the IC-751 HF transceiver, the IC-271 144 MHz
transceiver, and the IC-471 440 MHz transceiver all use a
microprocessor based controller. Each radio, of course, has different
operating parameters, such as frequency range, modes, etc. Therefore,
the operating system must be different for each microprocessor. Now,
rather than using a ROM to store the operating system, they chose to
use a CMOS RAM backed up by a lithium battery.

If the battery should become disconnected, or if it should go dead
(claimed life: 6-7 years), the RAM loses its contents, and the radio
becomes completely useless. Unlike older receivers that used a
tuning capacitor to adjust the local oscillator frequency, it is now
done digitally with a voltage-controlled-oscillator and a digital
counter in a feedback loop. Without the microprocessor running, the
digital counter no longer works and the radio ceases to function.
Completely. As one person mentioned earlier, it becomes a ~$700
doorstop. The only repair is to send the radio (maybe just the RAM
module, I'm not sure) back to Icom to have the battery replaced and
the RAM reloaded.

What will happen when Icom decides to discontinue support for this line
of radios? I tend to keep my radios a long time. I dread the thought
of being helpless to prevent these units from failing.

If I were more adventurous, I would build a circuit to dump the contents
of the RAM into my computer and save the result on disk. Then, I could
either reprogram the RAM myself, or burn some ROMs to replace the whole
module.

What could have been Icom's motivation for doing this? Are they really
out to screw the public by making the radios obsolete before their time?
Could it be cheaper to manufacture this RAM module than a similar ROM?
Do I sound bitter? You bet. I own an R71A and a 271H and I think they're
excellent radios. Really first class. Except for their built-in
obsolescense. I had planned on getting a 471 next year, but am now
reconsidering.

Tnx for reading & 73,

Where would one find a basic "buyers guide" to VHF ham gear? What I want
is a summary of the features and performance of the standard
VHF transceivers on the market today. Something akin to a
Consumers Reports listing. Does something like this exist?

If not, any advice on how to decide on VHF transceivers?

     many thanks, andy berman WD9EMZ

x

At last count, there were about 30 scanners here of various brands, but not all on at the same time! Having serviced Regency, Bearcat, Plectron, Sonar, Radio Shack, Craig, SBE, Motorola, and Heathkit monitor receivers to name a few, I still have 2 Tennelecs waiting for attention which they will probably never receive.

Scanner features often differ not only by model but by manufacturer. For instance, Radio Shack and most Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Regency only permits the delay to be enabled/disabled globally, that is, for all the channels at one time.

Both Bearcat and Regency, as well as Radio Shack offer some good models. I avoid the Bearcat 100, and scanners made by JIL, Fox, Tennelec, and Robyn. Radio Shack scanners contain a reasonable number of features, but scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $8.

In the name of cost cutting, some newer models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

Bearcat was just purchased by Uniden, maker of radios and cordless telephones.

Heath's new scanner is really a Bearcat 20/20 in semi-kit form, and should appeal to those who want to monitor the commercial aircraft band.

My favorite base/mobile scanners include the Bearcat 300, the Regency M400 (just discontinued), and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Regency HX1000 over the

6 Radio Shack PRO30s I've been through, although it's the Kenwood TR2600A scanning 140-160 MHz walkie-talkie that goes wherever I do.

Bearcat

BC300: 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogammed channels. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC20/20: 40 channels. Service Search only for Marine and Aircraft. Good scanner, but tinny audio.

BC250: 50 channel discontinued model. Lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. High frequency of repair. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units.

BC260: Super heavy metal cabinetry and lighted controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in older Bearcat scanners. Multiplexor circuitry for vacuum fluorescent display produces audible whine.

BC100: First programmable portable. Be prepared for at least repair in the 1st year. Early units, with threaded antenna connector, have high frequency of repair. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

Regency

K500: Nice wood-like cabinet. Discontinued 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemen-

ted as well as BC250, but better than none. Built in clock when radio off or in manual mode. Sensitivity could be better but can be programmed out of band.

M400: 30 channel replacement for K500, but now discontinued. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlighted keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: Current, 30 channel replacement for M400, but basic features only. Nice lighted keyboard. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner, and the most scanner for the money ($180 typical discount price).

M100: Discontinued 10 channel unit. Same as MX3000 except different color and fewer channels. Nice lighted keyboard.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

PRO2003: Radio Shack's top of line. 50 channels + 10 FM commercial broadcast band channels. Includes air-
craft. Good frequency coverage but very difficult to read keyboard makes scanner hard to operate. All keys close together and same color. Good audio, but slow scan rate and high price.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Low audio output. All-plastic case vs. metal frame in HX1000. Good belt clip. High price, no discounts or sales yet.

Summary:

In article <11294@brl-tgr.ARPA> ron@brl-tgr.ARPA (Ron Natalie <ron>) writes:
>Gene, get off it. Perhaps you would volunteer to moderate this list?
>Perhaps you'd like to moderate all the net groups so that problems
>won't occur?

No, I certainly don't want to moderate any groups. I do however
continue to advocate using "mod" groups for Arpa-gatewayed groups.
Let me explain the mechanism to make it a bit clearer.

Jill Usenetter wants to submit an article to the news for publication
in some newsgroup gatewayed to/from the Arpanet. She "posts" it
to the "mod" group using the standard news software (soon to be 2.10.3).
The article doesn't start propagating through the net from her node.
Instead, it gets mailed to the "moderator" of the group -- in this case,
the "moderator" is actually the news distribution software at the
gateway. The news software then "approves" the article (possibly with
the intervention of the moderator, in the case of a digestified
news list on the Arpanet), and gets sent out both to the Arpa side *and*
the Usenet side from the same site.a It is entirely possible
that no person acts as "moderator" in this setup -- we simply use
the built-in "mod" mechanism to support the list. It also provides
the means for an Arpa digest maintainer to get things from the Usenet
side in a consistent manner.

Other advantages:
     -- Since there is no possibility of followups beating
     their base article to the gateway, Arpanetters never have
     to contend with the common Usenet problem of reading
     responses to articles they haven't read yet. (This
     is also solved for Usenetters, BTW.)

     -- with the addition of a human in the mechanism, the
     newsgroup could be immediately available for Stargate,
     whenever that goes "live".

     -- there is almost no possibility of a "feedback-loop"
     whereby the same article gets posted to one network
     hundreds of times (this happens about every 6 months
     with one of the Arpa-gatewayed groups).

There, Ron, Have I "gotten off it"? Or did you have something
else in mind?

Summary: Ham radio and mayo packet on rye, to go

In article <460@mtunh.UUCP> jak@mtunh.UUCP (Jim Kutsch) writes:
>We (those involved) do not want a "mod." group. We have had net.ham-
>radio for years and have been successful in exchanging news with the
>ARpa info-hams list. All we want to do is create a subdivision.

See my previous posting about why I believe a "mod" group is preferrable.
As to your second point, "We've used oil lamps for years and they work
fine -- we don't want any of that newfangled electricity, by crackey!" :-)

>I do not understand why this is of such interest to all those who don't
>read net.ham-radio in the first place!!! We have subdivisions under
>net.religion, net.nlang and several others. If you really want me to do
>it I can post numerous private mail messages in support of the net.ham-
>radio.packet group. Is this really necessary? The idea here is just a
>subdivision of an existing group to better serve those who are involved
>in the group.

Each subgroup is another subdivision of the "net" group. I still have
some faint interest in seeing Usenet continue, although it is fading
fast these days, and I'd like to think that responsible individuals are
concerned about the effects on the net *as a whole* when they consider
new groups. That includes the effects of setting precedents. Also, the
interface to other networks is something we need think about.

I'm not claiming that there isn't support for your particular group,
and I'm sure you can cite lots of others who share your interests. But
someone could make the same claim for net.hamsters.and.duct.tape. We
need to discuss each group some before it's created to see what the
collective "wisdom" produces. There are some questions that need
answering such as: How many people will read this new group on the
Usenet? 50? Less? More? Would it be better served by making it a
mailing list? Would the net as a whole be better served by making the
new group a mailing list? Has anybody bothered to poll the current
Arpa list members to see if they *want* the Usenet gating?

>Also, Mr. Spafford, I answered your (somewhat presumptuous) private mail
>to me when you did the rmgroup. However, I have not seen a reply. I

>guess you would rather have all net folks read our correspondence?

I get, on the average, over 40 pieces of mail per day from people on 4 different networks. I tend to answer letters that indicate they need a response, and not much else. Besides helping to administrate 6 machines, I'm supposed to be finishing my thesis -- replying to every letter I get implies a luxury of time I don't have.

Your letter to me (as I remember) didn't really need a reply. You said you were posting to this group about the hows and whys of the group and the accidental creation thereof. That's how it normally works -- why did I need to write you back about that?

My mail may have been presumptuous in that I presumed that the group had been created by accident or mistake. I was not going to attribute the flaunting of net "rules" to stupidity or malice -- would you rather I had done that?

As for others reading our correspondence -- perhaps some of these issues need to be read and considered by others on the net. Surely you and I alone are not the ones to decide the fate of this new group, are we?

Ron, when creating a gateway group from Arpa to Usenet via a "net" group,
is bi-directional capability automatically provided?

If not, the "mod" approach is better than the "fa" approach because this
facility can be provided easily.

I would prefer to see all "fa" groups converted to "mod" groups, just to
simplify the news software, and provide for bidirectional transmissions.
As far as I am concerned, there need not be a "real" moderator for these
groups. Whenever articles arrive, they are automatically posted to Usenet,
and the ArpaNet (if necessary).

I, for one, am real tired of seeing so many articles on packet radio on the
net. It's refreshing to see anything other than this tripe. Sure, it might be
the wave of the future but, I really doubt it. I own a computer that is link-
ed (excuse me... Interfaced) to my rig but, I'd rather have a one-on-one QSO
WID TH OM (or OW) AT TH OTHER END ._._._

You overstate the every six months problem. I only ever recall seeing
one case that your AUTOMATED moderation would have helped. In other
cases, the problem lied elsewhere.

FA is not what I'm referring two. FA works by adding a dummy user to
our mail list that really is postnews. USENETTERS shouldn't even be
allowed to post to FA groups since they are supposed to be READ ONLY.

>

Find someone else to gateway then, BRL is not willing to support a lot
of UUCP mail. The NEWS is obtained by a different route than blasting
out our phone lines.

>the "permanent" part of the controller's memory.

This sounds very strange to me. Even if you are afraid of making a mistake
and want to avoid using ROMs, EPROMs are dirt cheap ($2). The battery and
CMOS RAM are probably more than this. So what reason could there be for
using RAM?

By the way, please don't be so clever with your ^H_s.

hr propagation forecast bulletin nr 21 from arrl headquarters
newington ct may 26, 1985
to all radio amateurs bt

may brought a marked reversal of the downward trend in solar activity that began last fall. in fifteen days ending may 22 the solar flux was 80 or higher daily. the major disturbed periods of april did not recur in may, so hf propagation was generally better than had been expected. if similar sun conditions prevail in the fall, the dx picture could improve markedly, especially on frequencies above 14 mhz.

at bulletin time the sunspot groups responsible for the higher solar flux had gone around the west limb, or had shrunk in size. the solar flux dropped from 93 on the 16th to 74 on the 26th. an area that was active april 28 to may 1 is in view again, but showing no important activity thus far, so no major hf propagation change is expected this week.

sporadic e skip was much in evidence on 28 and 50 mhz, and this upward trend will continue. since may 14, kf4ms, a 10 meter beacon in st. petersburg, fl, has been heard in the writers connecticut location daily since may 14, usually for several hours at a time. the bermuda beacon, vp9ba, has been logged nearly as often. the 50 mhz band has been waking up, and multihop contacts out to 2000 miles or more have been reported.

the number and duration of e openings will increase through june. high density sporadic e can affect lower frequencies adversely, but it is great for 28, 50 and possibly 144 mhz, in the summer months. transatlantic qsos may be possible on 50 mhz now that several european countries permit operation on that band after about 2200 utc.

american sunspot numbers for may 16 through 22 were between 43 and 21 with a mean of 30.3 ar

to all radio amateurs bt

fcc has authorized spread spectrum techniques in the amateur service, above 420 mhz. the report and order in docket 81 414, released on may 24, becomes effective in 12 months. this delay is intended to encourage the amateur community to develop voluntary standards for the use of spread spectrum. in the interim, special temporary authorizations will be available to interested amateurs. the commission also approved docket 81 413, a limited authorization for spread spectrum use in the public safety service, and the industrial, scientific and medical service. more information can be found in the arrl letter ar

business and ham band sharing proposed!
---

will the amateur radio service and the land mobile service make good bed partners? it appears we are going to find out. it also appears that they had better be or it is the hams that will be kicked off the band!

like it or not and with little advance fanfare, the fcc has issued a nprn proposing to allocate portions of the 421-430 mhz ham band to land mobile interests in the cities of detroit, cleveland and buffalo. this action is proposed to alleviate business band congestion caused by the proximity of the canadian border restricting use of both the 470-512 mhz and the 800 mhz business bands.

the commission wants to open 204 new business band channels each in detroit and cleveland and 114 channels in buffalo. manufacturers noted that this represents a potential market of more than 48,000 radio units. ge produces a land mobile product line retailing between $1,000 and $4,000 for export to canada and the middle east, which operates in the 421-430 mhz band proposed for the three u.s. border cities. motorola also makes land mobile gear for this spectrum.

a treaty arrangement was entered into with canada to obtain land mobile spectrum relief by an exchange of diplomatic notes on april 7, 1982, allowing both nations to operate their primary radio services in the band 406.1 to 430 mhz along border areas. "this arrangement, coupled with the cooperation of the executive branch," the fcc said, " will permit land mobile use in portions of the 421-430 amateur band in detroit, cleveland and buffalo." the executive branch cooperation had to do with releasing spectrum reserved for us military radar.

the legalities of this arrangement are cloudy to us since the us arrangements clearly hold the 420-450 mhz band in the united states to be allocated to "amateur" - secondary only to government radiolocation. the region 2 itu allocation, however, is to the fixed, mobile and radiolocation services.

the nprm proposing land mobile and amateur sharing reads:

"we do not propose to change the amateur allocation. amateurs would have to avoid causing any interference to land mobile because we propose to make land mobile a primary service. if land mobile systems with 30 mile operating ranges and located within 25 miles of the center of these cities are to be practical, they must be protected from interference by a buffer of at least 45 miles."

"if the secondary allocation is not sufficient, we would consider prohibiting amateur operation in the 421-430 mhz band within approximately 100 miles of the center of these cities. we specifically seek comments on this alternative."

the fcc said that they could prohibit amateur operation should the need arise by adding language to footnote ng-135 stating that the amateur service is prohibited in certain counties in ohio, west virginia, pennsylvania and new york, and in the areas enclosed between these counties and line "a".

this proposal was a real shocker and "came out of the blue" with no advance warning!

Now available from SIMTEL20:

Filename	Type	Bytes	CRC
Directory MICRO:<CPM.PACKET>			
PACKET93.LBR.1	BINARY	219648	0C0BH

PACKET93.LBR contains the files that make up version 9.3 of the W0RLI Packet Radio MailBox/BBS/GateWay system.

This system runs on the following hardware:

Computer:
     Xerox 820-1 computer (the ones that were available for $50,
                    and are still around for not much more),
     one or more 8" single density, single or double sided disk drives,
     parallel keyboard, CRT monitor.

Packet Radio gear:
     One or Two TAPR (or AEA) TNCs with version 3.1 or later software.
          (Two TNCs if you are going to run a crossband Gateway.)

Radio gear:
     One or two transceivers.

The W0RLI software supports sending, receiving and forwarding mail, uploading and downloading files, capturing typescripts, logging channel activity and mailbox activity, and gateway operation between two TNCs on two bands.

Read the file NOTES.TNC to start working your way through the documentation.

Hank would appreciate knowing of users who are running this software.
A QSL to Hank or a net message to me would be appreciated.

Here is Hank's update from the February 1985 NEPRA PacketEar:

   The MailBox/GateWay has now been sent to 25 states and 5 countries. As far as I know for sure, it is on the air at least 20 places now. In the Boston area, 4000 messages have passed through it. The local forwarding network now includes 9 nodes: W0RLI, WB2OSZ, WB1DSW, K1BC, WA2RRKN-2, K7PYK, WA4SZK, KA1T, W1AW-4. The last two run their own software, but allow for forwarding from the W0RLI systems.

   A message put into any one of these systems will find its way to the system nearest the intended recipient.

   There are several other areas of the country now using the software: Georgia, Arizona, Iowa, Washington DC, Seattle, ENY/NYC/NNJ, Dallas, Illinois, Southern New Jersey, Los Angeles have all been heard from. All have the software in daily use.

   Expect to see it on Oscar-10 at KL7GNG soon.

   Look for it from Australia, New Zealand, Japan, Hungary.

   Sacramento county RACES will be using it.

   GateWays are running at W0RLI, K7PYK, WA4SZK and WB7DCH.

                        de Hank Oredson, W0RLI

The following is an extract from the file NOTES.TNC for version 9.3 of the W0RLI MailBox and GateWay software. This extract contains the list of changes since the last distribution to the SIMTEL20 repository, which was version 8.6.

W0RLI, Hank, does not have access to either ARPANET or USENET.
I will be glad to try to answer questions or to relay them to Hank.
I can be reached at:

   ARPANET: CLEMENTS@BBN
   USENET: {ihnp4, decvax, linus, ...}!bbncca!clements

73,
Bob Clements
K1BC

--- excerpt from NOTES.TNC follows ---

     W0RLI MailBox and GateWay   Version 9.3 - 5/16/85

Created and distibuted to the packet community by:

  Hank Oredson, W0RLI
  19 North Hill Road
  Westford, MA 01886

These notes are rough, more release notes and tech notes than anything else. A SYSOPS Manual (Very nice, 25 pages or so) is available for 8-1/2 x 11 SASE ($1.24 postage) from:

  Jon Pearce, WB2MNF
  109 Pine Cone Trail
  Medford, NJ 08055

A very nice log file analyzer was written by:

  Tom Hogan, WB7DCH
  26911 S E 456 St.
  Enumclaw, WA 98022

I have included this on the release disk as LFA.COM.

Release notes, Version 9.3 :

In version 9.0, there was a change to the structure of the mail file. When TNC is first run, it will update the mail file to the new structure. This is done by doing an untangle. Don't panic when this happens the first time you run version 9.3!

     Changes and additions since version 9.2 are:

Added privelege A and B, excluded on A or B ports.
Removed LA and LN, was bad idea.
Support for S W0RLI @ K1BC installed...
Added H local command: short / long menu (=Help).
Added $X, $Y, $Z : Date, time, current msg # at last login.
Verify for files specified in config.tnc that the drive is on line and write enabled.
L now lists new, LN same, LA lists all.
Faster forward - send "S XXX" and title then eat 2 lines.

     Changes and additions since version 9.1 are:

Much faster untangle.
D, DP, DU for remote sysop.
CP ON/OFF and CR ON/OFF for remote sysop.

     Changes and additions since version 9.0 are:

"Remote sysop" feature added.
Better handling of user record currency.
Excluded user disconnected with no "bye" message.
Fixed bug - long packets not get monitored properly.
Added ki4xo changes for 5" to boot, sbios, cbios.
Added GM, GU, OA, OB, C <call>.

Changes and additions since version 8.9 are:

Some changes to CBIOS thanks to ke1g give faster disk I/O
Added user privilege check. If E, then user is excluded from
use of the MailBox. N is used for normal user, and is default.
Fixed connect bug - now conok on is last sent, conok off is first.
Most searches go most recent first.
Added LL (List Last n), and LN (List New).
User file version 1, and DU - Display Users, EU - Edit Users.
Mail file structure version 2, back chaining of msg headers.
N menu item, rename file.

Changes and additions since version 8.8 are:

Fixed (again) the disconnect process.
Added DP - page mode.
G menu item replaces UNTANGLE, GR to renumber the messages.
L and private msg, show only to owner/sender/addressee.

Changes and additions since version 8.7 are:

Name of CONFIG.TNC file can be specified at execution time:
TNC OLDCFG.TNC or TNC NEWCFG.TNC for example. Defaults to CONFIG.TNC
if not specified.

The names for files CALLS.TNC, FWD.TNC, LOG.TNC specified in CONFIG.TNC
Installed ke1g improved cbios. Thank you Bill.
Y replaced by YC, YF, YL, switch calls, forward, or log files.
Fixed (I hope) the "Can't DISCONNECT, Link state is..." bug.
Added Z (delete file) to local menu.
X menu item forces forward regardless of hours given in FWD.TNC.
Was not passing "*** LINKED to" thru from next GateWay.
Not allow GateWay connect line with "tran" at end.

Changes and additions since version 8.6 are:

Fixed (again!) the lack of timeout when bombarded with con req.
Added UA (append) option to local menu.
Fixed dayclock month rollover.
Split EDMSG, FWD, MBFILE as separate routines.

Subcarrier Transmissions Noted in the NY/NJ Area

On a recent trip to the northern New Jersey area, I did some subcarrier listening by connecting the antenna jack of a Yaesu FRG7700 receiver to the audio stage of a cheap television set:

- By tuning the Yaesu to 88.0 kHz FM, and the TV to channel 4, WNBC-TV New York was heard rebroadcasting WYNY-FM audio. WYNY is an NBC affiliate station.

- By tuning the Yaesu to 31.5 kHZ USB, and the TV to
channel 68, the audio of WWHT-TV Newark, a scrambled TV station, was monitored.

Other signals were heard, including a series of 6 or 7 telemetering tones sent every 30 seconds on an FM subcarrier of a TV station.

Several FM broadcast stations in the New York area were also using subcarrier technology. One station was transmitting 3 different subcarrier channels of information concurrently.

Subject: Routing and Addressing

I am interested in routing and addressing issues associated with amateur packet radio, and am wondering what people have done so far. I read Phil Karn's paper in the proceedings of the 4th Networking Conference. The emphasis of that paper was mainly on the way things are done on the ARPA Internet.

I agree with his recommendations, and would like to get started on solving (or attempting to solve) the problem. Here are my present ideas on the subject.

Naturally, a full address should specify a host. The first three fields of the internet address (one of which is fixed) should specify a physical subnet. What I mean by a physical subnet is a collection of machines which can talk to one another directly (i.e. not using a digipeater). With this limitation, 8 bits may seem like a lot to allocate for hosts within a subnet. It isn't though, since repeaters may be used to extend the coverage of a subnet.

One (or more) machine(s) on each subnet should be on another subnet and should act as a gateway between the two. As with the ARPA internet, subnets can be tied together by a subnet one level up in the hierarchy which has at least one host per lower level subnet, each of these hosts acting as a gateway.

I think that the current emphasis should be on getting local subnets set up. As I mentioned, regular repeaters (as opposed to digipeaters) should be used to extend the range of the local subnets. Use of regular repeaters should cut some of the latency since the repeater would transmit as it is receiving the packet instead of storing it, and only retransmitting it after receiving the whole packet. We are about to set up a repeater at MIT for packet work.

Subject: Packet Radio field sizes

I read the article to this mailing list by Clifford Neuman <bcn@mit-eddie.ARPA> about routing ideas. I am interested in packet radio, but have done nothing about it for lack of money. I have not read the papers to which he refers, but do have one suggestion.

Here at Los Alamos, we have an Integrated Computer Network of

many computers. A friend of mine was working at a site, and they chose an 8-bit field. He suggested 16 bits. They said that 8 was enough, and would never be exceeded. Fortunately, he persuaded them to go with 16 bits. Now, about 5 years later, they have about 250 machines and adding more.

Please use 16 bits, at least! I know, you will never have more than 256 machines in one subnet. But if it does happen and packet radio catches on (as it is already doing), there might be such a concentration in one area in the near future. Better to have a large, unused field in the protocol than have to redo the protocol at a later date because the sizes were exceeded. Build in plenty of room for expansion!

Richard Thomsen
rgt@lanl

From michel@bbncct Mon May 20 07:49:53 1985
Subject: Routing and addressing

Clifford Neuman raises the issue of routing. Let me carry over some lessons from the Internet. Again, these are personal lessons with which other Internetters might not agree.

The original Arpanet was designed to be a small network. Quite early on the address field was expanded from 8 bits to 24 bits. But the mentality remained, that all network users would know or be easily able to figure out the physical address of a correspondent. One result of this seems to be that now that the INternet is grown to very large, world-wide proportions, addressing and routing are quite out of hand. The problem is that given a 32 bit Internet address, you can't figure out from the address what to do. The reason is that the network numbers (the first three fields of an address) don't have any topological significance. Network 194.1.1 might be in Japan while 194.1.2 could be in England. What this seems to mean is that each switching node must keep a table listing all networks, and the best strategy to get to each possible destination. Even now this is pretty unwieldy, and is a principle limit on the number of network numbers which can actually be assigned (or at least supported).

The Internet is evolving various clever, ad hoc schemes to cope, but none is really ideal for the ham radio packet environment.

A different approach has been taken by the CCITT in their design of an internetwork. Recommendation X.121 divides the world into 10 major regions, and further subdivides these into smaller regions, mostly according to political boundaries. Given nothing but the address, you can get fairly close to your destination. Any remaining ambiguity is presumed to be small enough to be handled by a local nameserver or table lookup in the switch, or something simple.

THere are some troubles with X.121, mostly due to its Telephone company orientation. It presumes there will be few networks in any one country, ideally only 1. But it allows for variable length addressing,

so that "area codes" with few networks can assign short numbers within
the area.

At this early stage of ham packet, the choice could still be made either
way. I'd recommend the CCITT way. It might be that the X.121 choices
are suitable as they stand. Perhaps the amateur fraternity should re-allocate
the numbers. Perhaps the world-wide telephone numbering system could
be used. Perhaps some derivative of the world-wide radio call sign
prefix allocation would work. Any of these is superior to no system
at all.

I personally favor the telco approach. Addresses are allocated to geographic
areas, and coded by expected frequency of use. Actually the European
telcos did it better than AT&T by adopting variable length numbers.
Addresses in the big city begin...1-some number of digits. Address in
a rarely addressed location in the provinces might have a long prefix.
Once inside an area, there is a similar coding. Popular addresses are
given short codes. SInce this might seem to "discriminate" against
the residents of the provinces, an escape is available for dialing
local numbers. If you want a local number, you do not attach the "long
distance" prefix. More or less like our telephone system.

How long is the maximum address? In the telephone system 10 or 15 digits
is a LONG nnumber, outside the USA. Coded as BCD, that is very
manageable. In the protocol research community some advocate much
different schemes. One scheme calls for addresses to be ASCII (actually
"international alphabet #5") strings of up to 255 characters. Such
an address could be read directly on a datascope, presumably, as it
went whizzing by.

Who allocates the area codes? Hmmm.... This is the hardest problem, by
far. Sounds like diplomacy.

Who maintains the "directory?" The white pages? (Sorted by name)
The yellow pages? (sorted by some other consideration)

Once the address assignment mechanism is chosen we can grapple with
routing. SHould the user be allowed to specify a route (explicit
routing)? If the address assignment is not systematic/topological, you
need this capability. Telephone systems once had this, and phased
it out in most places because it's unwieldy. WHen the net diameter
gets big, you need a lot of overhead in the message just to carry the
route info.

I think it's worth considerable effort at the beginning to get this right.
Designs tend to get entrenched, and that which we do today as a hack
may last a long time.

Subject: Status report from Dave Mills

Here is a copy of a status report sent by Dave Mills (mills@dcn6) on the ninth of this month:

> You can report that initial tests using IP/TCP were carried out using an LSI-11 and experimental software used on the ARPANET and DARPA Internet systems. A Heath TAPR board was operated in transparent mode via the WB4JFI-5 and W3VD-5 digipeaters on 145.01 MHz. The tests were carried out using virtual-terminal, file-transfer and mail protocols with traffic looped via a digipeater back to W3HCF. Additional tests using special performance-measurement protocols revealed disturbingly high packet-loss statistics of one in ten via the WB4JFI-5 digipeater and one in four via the W3VD-5 digipeater, but confirmed the viability of the IP/TCP protocols and implementation over typically raunchy Amateur circuits.
>
> Further tests using an IBM Personal Computer and an IP/TCP software package from MIT over the same channel were inconclusive due to inadequate timeouts in the MIT software. The authors of the software have been advised of this and, hopefully, can be persuaded to fix the problem. The MIT software, which is publicly available, provides virtual-terminal, file-transfer and several utility functions using standard DoD protocols, including IP/TCP.
>
> Dave

Subject: Routing issues

I agree with Tony Michel that the current Arpa Internet addressing and routing schemes are not well suited to the amateur radio environment. However, I think the real issue is hierarchical vs (relatively) flat addressing, and we can solve the problem without tossing out IP.

The fundamental problem with the current Internet model is the implicit assumption that all hosts within a "network" (whether class A, B or C) can communicate directly, without IP's help. In other words, as far as IP is concerned, the Internet is a hierarchy with two and only two levels, "network" and "host".

About the only way under the current conventions that a collection of hosts who are NOT fully interconnected can be made into an Internet is to assign fully interconnected subsets to small Class-C nets, or to exchange routing information at the host-specific instead of network level. Both of these techniques tend to result in routing table explosion.

Clearly this restriction has already become a problem with current Internet, even ignoring the extra problems of packet radio; hence the big flurry of RFCs on subnet addressing schemes. The proposals had in common the addition of at least one new level in the addressing hierarchy, but in my opinion they are all too ad-hoc for amateur packet radio, and will probably become obsolete eventually for general Internet use as it grows even more.

I believe that the most general scheme would be the best. It would allow an arbitrary number of levels within the constraints of a 32-bit IP address, with the bit field boundaries being completely variable. Routing table entries would consist of variable-length bit strings representing prefixes on IP addresses; an entry is used if the leading bits of the target address match the corresponding bits in the routing table. The special cases of 0 and 32 bit long table entries would correspond to the current notions of default and host-specific entries, respectively.

As I mentioned, a gateway need not concern itself with the actual "meaning" of the bits in an address; it would simply try to "collapse" all routing table entries with a common prefix and routing decision (i.e., the same next hop) into a single table entry as a means of saving table space. There is no need for a gateway to retain any more information than that necessary to make a routing decision.

For this reason, I am not really concerned with the actual boundaries and procedures that are established to assign IP addresses, so long as they are done in a hierarchical manner. Only the meaning of a few leading bits need be established on a worldwide basis to denote major regions (countries or continents, etc). National entities would then establish the boundaries for the next lower level in the hierarchy and "take" enough bits to encode them. The task of assigning the remaining bits is likewise delegated recursively until they're all gone (and hopefully you've reached the end host!) All along the way, the boundary assignments should be made with an eye towards the topology of the network in the specific area, so that as many routing table entries as possible can be "collapsed" together. If the regions at any level of the hierarchy differ in population then a Huffman-like variable width subfield encoding scheme should be used to conserve bits.

There is no requirement that the number of levels be the same for all hosts, nor that the number of bits needed to designate any one entity within a hierarchical level be the same. This makes the scheme as flexible as possible and highly adaptable to local needs.

ARPA has already assigned Class A network number 44 to amateur radio, so that leaves us 24 bits to play these games with. This means we can address 16 million hams, so I think the job ought to be doable.

I presented this scheme in more detail in my ARRL Computer Networking Conference paper "Addressing and Routing Issues in Amateur Packet Radio". I'm very interested in comments and suggestions on this scheme. I certainly doubt that this idea is completely original with me (I seem to recall a mention of Danny Cohen at ISI proposing something similar) so if others have tried this scheme and failed, I'd like to know why. About the only problem I can see is the speed of the routing table lookup. However, I suspect that caching would help greatly here since a gateway is probably handling packets to only a few destinations over any short interval.

73,

Phil Karn, KA9Q

From bellcore!karn@Berkeley Mon May 20 23:41:12 1985
Subject: Re: IP over X.25 - the CSNET experience

Paul, thanks for your comments on CSNET. I am somewhat familiar with CSNET, as another one of the developers is here in my group at work. So I am not totally naive as to the many problems caused by X.25. In fact, I have often used his experiences, which were essentially identical to yours, as potent ammunition against those who blindly tout X.25 as the ultimate networking solution. We have a Telenet connection, and as soon as we get the CSNET software I'll be able to experience these joys first hand.

Perhaps the main difference between X.25 as seen by CSNET and AX.25 as seen a ham user is that AX.25 consists ONLY of the link layer (LAPB) from X.25; there is no packet layer as such. What this means is that there is no concept of a "message" spaning more than one physical frame. If we wanted to do "implicit" IP fragmentation, we would have to add an extra mechanism to denote the beginning and end of the datagram. This could be done, for example, by encapsulating the datagram with SLIP and sending it as serial data (ignoring link frame boundaries altogether), or by defining a few more AX.25 "level 3 protocol IDs" to indicate "head", "middle" or "tail" of a datagram. Both approaches are kludgey, to say the least. Don't forget that even the "reliable" (i.e., connected) mode of AX.25 can lose packets so whatever encapsulating method you use still has to be able to resynchronize after lost physical frames. [If you want the gory details on the flaws in AX.25, (and LAPB, too, to be fair) let me know and I'll make it the subject of a separate message.]

If on the other hand there is a one-to-one correspondence between IP datagrams and AX.25 frames, then other things become much easier, e.g., mixing sequenced (I) frames with datagram-like unnumbered (UI) frames depending on the setting of the IP "reliability" bit. The cost is, of course, the extra overhead of the duplicated IP headers.

The problem with just getting rid of the connection-oriented link (AX.25) layer and relying totally on TCP is that our links are currently so bad that hop-by-hop acknowledgements are often essential just to get reasonable performance over a long connection. I've worked out the formulas for the expected number of transmissions across all nodes for three acknowledgment strategies (end-to-end only, explicit hop-by-hop, and implicit (echo) acknowledgments without duplicate filtering). If anyone is interested I can post the gory details here.

If anyone can suggest a link-level acknowledgement scheme other than the two I just mentioned, I'd certainly be interested, particularly if it's easier to implement and more efficient when sending datagram traffic than the go-back-N scheme in the connected mode of AX.25 (LAPB).

Phil Karn

Subject: Conference papers available on line

I have put up the two papers I wrote for the Fourth ARRL Computer Networking Conference on machine "umd5". They can be retrieved with the "anonymous" ftp convention as:

packet-radio/routing - Addressing and Routing Issues in Amateur Packet Radio
packet-radio/tcp_ip - TCP/IP: A Proposal for Amateur Packet Radio Levels 3 and 4

Thanks to Louie Mamakos (louie@umd5) for making the necessary arrangements.

Phil Karn

From bellcore!karn@umd5 Wed May 22 15:30:29 1985
Subject: Packet Radio paper in IEEE JSAC

I am proud to announce the publication of the paper "Packet Radio in the Amateur Service" by Harold Price, NK6K, Bob Diersing, N5AHD and yours truly, KA9Q, in the May issue of IEEE Journal on Selected Areas in Communications, pp. 431-439.

I guess this means that amateur packet radio has "arrived"!

Phil

From CHEPPONIS@CMU-CS-C.ARPA Thu May 23 11:25:32 1985
Subject: link quality query; book recommendation

A few days ago, Dave Mills posted a message giving present amateur packet link quality data for IP/ICMP using loopback through two digipeaters. The packet loss rates varied from 1 out of 10 lost to 1 of 4 lost.

I'm wondering: would using Hamming coding on the link level reduce these rates? And what sorts of interference, etc., caused the packet lossage in the first place? (QRM, hardware failure, whatever).

Also, a truly delightful book by Michael A. Padlipsky titled "The Elements of Networking Style" (Prenice-Hall 1985) gives insight into networking from an "Old Network Boy's" point of view. Find out why he thinks the ARM (ARPANET Reference Model, including TCP/UDP/IP) is the way to go, and why ISORM (The ISO Reference Model, pronounced "Eye Sore mmmm") is a loser. And lots of other networking stuff. Highly recommended! (Aside to Phil: Have you sent a copy to Terry yet?)

-Mike, K3MC

From CHEPPONIS@CMU-CS-C.ARPA Thu May 23 13:38:31 1985
Subject: Another advantage of datagrams

It just occurred to me how datagrams may be a very big win over Virtual Circuits: high bandwidth point-to-point links with low bandwidth links in between. Think of it as a sort of "frequency" division multiplexing.

If we assume the source produces datagrams at a high rate, these datagrams can be carried by multiple (possibly slow) links and eventually be reassembled at the (high bandwidth) destination.

Virtual Circuits, however, suffer from the "weakest link" principle: The greatest bandwith through a VC is limited by the bandwidth of the slowest link.

BTW, are there any VC proponents on this list? -Mike, k3mc

From bellcore!karn@umd5 Thu May 23 15:45:18 1985
Subject: Re: link quality

My personal intuition, from operating on 2m packet radio for about 2 years, is that the poor quality of present amateur links is due to two main reasons:

1) The modems themselves are rather inefficient. Bell 202 modem tones on an FM main carrier make very poor use of bandwidth and S/N ratio. The slow transmission speed means that the channel is easily congested, leading to frequent collisions, and of course the poor S/N efficiency leads to higher bit error rates. The 9600 bps direct FSK modem designed by Steve Goode, K9NG, has achieved bit error rates 3 db better than the TAPR 202 modem at 1200 bps, despite the 8:1 speed improvement, given equal RF power levels and bandwidths.

2) The networks are highly prone to "hidden terminal" problems. Although each station waits for a clear channel before transmitting, the following happens very frequently. Consider three stations, A, B and C. A can hear B; B can hear C, but A cannot hear C. C is sending a packet to B. A wants to send a packet. Hearing nothing on the channel, it barges in on C's transmission and clobbers B's reception. This problem is aggravated by the lack of proper backoff algorithms in the present packet radio controllers. The channels fall easily into congestion collapse, and only when the controllers begin to abort connections does the traffic fall back to a productive level.

Phil

From @DCN6.ARPA:mills@dcn6 Fri May 24 13:32:27 1985
Subject: Phill Karn papers

Folks,

Copies of Phill Karn's papers from UMD5 are now on DCN1. The one called packet-radio/routing is in PROUTE.TXT and the other called packet-radio/tcp_ip is in PTCPIP.TXT, both in the RFC login with RFC password. DCN1 is three gateways closer to ARPANET than UMD5, but is a fuzzball (not Unix) system.

Dave

Subject: Re: Another advantage of datagrams

Mike, this is called "load sharing". This is a special case of adaptive routing, which can be one of the major advantages of a datagram subnet.

The VC advocates counter that this is too "difficult" a thing to do, and therefore conclude that it isn't a real advantage. However, if you look through the later revisions of X.25 and X.75, you'll see them working like mad adding something called "multi-link procedures". This allows them to gang together more than one physical link between two points, although this is far more difficult and less powerful than true adaptive routing in a datagram network because packets have to be resequenced at each link point.

This seems to be a favorite ploy of the VC types. While they loudly proclaim that a certain innate advantage of datagram protocols isn't worth anything, behind the scenes they're scurrying about like mad trying to kludge it into their own protocols.

Phil

Subject: Bugs in AX.25

The bug I alluded to in my earlier message has to do with the possible loss of I-frames that can result from just ONE frame being lost on the transmission link.

Consider the following scenario. (Knowledge of AX.25 state transitions is assumed.)

TNC A, attached to a terminal, wants to initiate a connection to TNC B, attached to a bulletin board system. A sends an SABM to B and goes into the Connect Pending state. TNC B receives the SABM, responds with a UA, and goes directly from the Disconnected state to the Connected state.

HOWEVER, the UA is lost in transmission. TNC B, since it is in the connected state, is free to transmit I-frames and since its local client is a bulletin board, does so with the BB's login banner.

TNC A is still in the connect pending state, since it never received the expected UA response to its SABM. It therefore has to ignore B's I-frames and, eventually, retransmits its SABM. However, this is interpreted at B as a link reset: clear all state variables and flags, and go to the connected state. The frames B transmitted earlier (the I-frames containing the BB's signon messages) are lost.

A number of people have reported this phenomenon with bulletin board systems, so it is not just a theoretical possibility. I suppose I could coin Karn's corollary to Murphy's Law for communications protocols: if a failure mode is POSSIBLE in the protocol, no matter how "unlikely" it seems, then it is ABSOLUTELY GUARANTEED to occur (eventually).

This problem seems to be fundamental to LAPB and cannot be solved without the use of a three-way handshake. Such a handshake is provided as standard equipment in TCP, but not everybody is convinced...

Phil Karn

From @DCN6.ARPA:mills@dcn6.arpa Sat May 25 21:42:46 1985
Subject: TAPR considered unfriendly

Folks,

I tried valiantly today to twinkle unsequenced (datagram) packets using the TAPR board, but got ambushed at every turn. I used raw Internet Protocol (IP) packet formats sent by a fuzzball and looped in full-duplex mode back to itself, a trick which works in transparent mode with sequenced (virtual circuit) packets. Unfortunately, the TAPR board not work in transparent mode with unsequenced packets; therefore, today's ambushes were in converse mode.

My first battle was simply to prefix all control characters (there are about eleven in the TAPR converse mode) with the literal-next (PASS) code to insure character transparency, but the Tuscon boys have laid their traps well. Converse mode is intended for chit-chat between consenting, vanilla ASCII terminals; therefore (?), only seven bits are significant, even if the UART parameters are set for eight bits and no parity. The Principle of Least Astonishment would suggest all eight bits as significant, even if control-character interpretations were masked to seven bits. This makes it easy to win transparency battles, and also allows parity to be checked on an end-end basis.

I counterattacked with the time-honored trick of encoding three octets as four septets encapsulated as vanilla, upper-case ASCII characters preceeded and succeeded by a couple of non-TAPR control characters, so that the miscellaneous TAPR gratuitous commentary could be suppressed. That hideosity worked and the unsequenced IP datagrams did fly; however, the TAPR commandos decided unsequenced packets longer that 128 octets were not polite, in spite of the fact that sequenced (tranparent) packets up to 256 octets work fine.

For my next raid, I carefully broke packets longer than 128 octets into fragments no longer than 128 octets, with each one terminated by the send-packet TAPR control character. But this meant that the character following a fragment terminated by the send-packet character could wander into the TAPR board hard on the heels of the send-packet character itself, unless some kind of timeout intervened. In spite of a generous amount of buffer storage and in spite of this situation working fine with sequenced packets, the TAPR folk simply amputated anything longer than 128 octets. One would assume they feared a congestion-gas counterattack.

I conclude the braindamage has gone far enough and trying to trick the TAPR board into unsequenced transparency is interpreted as indecent exposure. I should have kept my clothes on, having warred this way with more operating systems than I care to admit. Until I do something dramatic, like write an AX.25 driver for the fuzzball, I will TAPR IP only in sequinned nudity.

Dave

From Elias.PDO1@MIT-MULTICS.ARPA Mon May 27 18:05:03 1985
Subject: A network primer on networking?

My congratulations to Cliff for starting this net, and to everybody else who has contributed interesting and sometimes hilarious entries on this important subject; they made me realize that there is more to networking than sending $164.95 plus postage and handling to GLB Electronics. They also made me realize that my claims to electronic knowledge and computer wizardry shrink to subparticle proportions when confronted with the world of networking, a subject about which some people even write their Senior Thesis.

So. I would like to propose that you wizards out there get together and prepare a set of files explaining "Networking for Laypersons". In particular, It would be nice to see something like a set of (three?) files, each discussing the area in successive levels of detail (layers?); the first one could be a tutorial version of pages 19-21 to 19-31 of the 1985 Amateur Radio Handbook; in particular, I think you guys could do better than the Handbook in two ways:

1- You seems to know the stuff better, at least by comparing the alphabet soup you use with the glossary on page 19-30.

2- You could pattern it to the "learning packeteer", instead of attempting the double education-reference scope of the Handbook (admirable, but confusing).

The next files could dwell on the relative merits of Virtual Circuits versus unsequenced datagram packets, etc., not in the flaming mode reserved for the actual mailing list transactions, but in a paused, academic way (.... .. ..).

Now; if only these files could be created, placed, accessed, and edited in a location where a large number of mailing list readers could access them, I can see the following process happening:

1- Info-Hams aficionados, like myself, will be informed of the existence of such files and how to read them.

2- After reading them, one would get a much better appreaciation of what's going on on packet-radio (and the real world, for that matter).

3- The real wizards, meanwhile, keep these tutorial files updated while flaming on packet-radio.

Who knows, we may get the first net-wide book... on the subject of networking, which seems to be appropriate...

Sender: CLEMENTS@BBNG
Subject: W0RLI Packet Radio Mailbox/BBS/GateWay system Version 9.3

Now available from SIMTEL20:

Filename	Type	Bytes	CRC
Directory MICRO:<CPM.PACKET>			
PACKET93.LBR.1	BINARY	219648	0C0BH

PACKET93.LBR contains the files that make up version 9.3 of the W0RLI Packet Radio MailBox/BBS/GateWay system.

This system runs on the following hardware:

Computer:
     Xerox 820-1 computer (the ones that were available for $50,
                    and are still around for not much more),
     one or more 8" single density, single or double sided disk drives,
     parallel keyboard, CRT monitor.

Packet Radio gear:
     One or Two TAPR (or AEA) TNCs with version 3.1 or later software.
          (Two TNCs if you are going to run a crossband Gateway.)

Radio gear:
     One or two transceivers.

The W0RLI software supports sending, receiving and forwarding mail, uploading and downloading files, capturing typescripts, logging channel activity and mailbox activity, and gateway operation between two TNCs on two bands.

Read the file NOTES.TNC to start working your way through the documentation.

Hank would appreciate knowing of users who are running this software. A QSL to Hank or a net message to me would be appreciated.

Here is Hank's update from the February 1985 NEPRA PacketEar:

   The MailBox/GateWay has now been sent to 25 states and 5 countries. As far as I know for sure, it is on the air at least 20 places now. In the Boston area, 4000 messages have passed through it. The local forwarding network now includes 9 nodes: W0RLI, WB2OSZ, WB1DSW, K1BC, WA2RRKN-2, K7PYK, WA4SZK, KA1T, W1AW-4. The last two run their own software, but allow for forwarding from the W0RLI systems.

   A message put into any one of these systems will find its way to the system nearest the intended recipient.

   There are several other areas of the country now using the

software: Georgia, Arizona, Iowa, Washington DC, Seattle, ENY/NYC/NNJ, Dallas, Illinois, Southern New Jersey, Los Angeles have all been heard from. All have the software in daily use.

   Expect to see it on Oscar-10 at KL7GNG soon.

   Look for it from Australia, New Zealand, Japan, Hungary.

   Sacramento county RACES will be using it.

   GateWays are running at W0RLI, K7PYK, WA4SZK and WB7DCH.

                        de Hank Oredson, W0RLI

The following is an extract from the file NOTES.TNC for version 9.3 of the W0RLI MailBox and GateWay software. This extract contains the list of changes since the last distribution to the SIMTEL20 repository, which was version 8.6.

W0RLI, Hank, does not have access to either ARPANET or USENET. I will be glad to try to answer questions or to relay them to Hank. I can be reached at:

   ARPANET: CLEMENTS@BBN
   USENET: {ihnp4, decvax, linus, ...}!bbncca!clements

73,
Bob Clements
K1BC

--- excerpt from NOTES.TNC follows ---

     W0RLI MailBox and GateWay   Version 9.3 - 5/16/85

Created and distibuted to the packet community by:

  Hank Oredson, W0RLI
  19 North Hill Road
  Westford, MA 01886

These notes are rough, more release notes and tech notes than anything else. A SYSOPS Manual (Very nice, 25 pages or so) is available for 8-1/2 x 11 SASE ($1.24 postage) from:

  Jon Pearce, WB2MNF
  109 Pine Cone Trail
  Medford, NJ 08055

A very nice log file analyzer was written by:

  Tom Hogan, WB7DCH
  26911 S E 456 St.

Enumclaw, WA 98022

I have included this on the release disk as LFA.COM.

Release notes, Version 9.3 :

In version 9.0, there was a change to the structure of the mail
file. When TNC is first run, it will update the mail file to
the new structure. This is done by doing an untangle. Don't panic
when this happens the first time you run version 9.3!

Changes and additions since version 9.2 are:

Added privelege A and B, excluded on A or B ports.
Removed LA and LN, was bad idea.
Support for S W0RLI @ K1BC installed...
Added H local command: short / long menu (=Help).
Added $X, $Y, $Z : Date, time, current msg # at last login.
Verify for files specified in config.tnc that the drive
is on line and write enabled.
L now lists new, LN same, LA lists all.
Faster forward - send "S XXX" and title then eat 2 lines.

Changes and additions since version 9.1 are:

Much faster untangle.
D, DP, DU for remote sysop.
CP ON/OFF and CR ON/OFF for remote sysop.

Changes and additions since version 9.0 are:

"Remote sysop" feature added.
Better handling of user record currency.
Excluded user disconnected with no "bye" message.
Fixed bug - long packets not get monitored properly.
Added ki4xo changes for 5" to boot, sbios, cbios.
Added GM, GU, OA, OB, C <call>.

Changes and additions since version 8.9 are:

Some changes to CBIOS thanks to ke1g give faster disk I/O
Added user privilege check. If E, then user is excluded from
use of the MailBox. N is used for normal user, and is default.
Fixed connect bug - now conok on is last sent, conok off is first.
Most searches go most recent first.
Added LL (List Last n), and LN (List New).
User file version 1, and DU - Display Users, EU - Edit Users.
Mail file structure version 2, back chaining of msg headers.
N menu item, rename file.

Changes and additions since version 8.8 are:

Fixed (again) the disconnect process.

Added DP - page mode.
G menu item replaces UNTANGLE, GR to renumber the messages.
L and private msg, show only to owner/sender/addressee.

     Changes and additions since version 8.7 are:

Name of CONFIG.TNC file can be specified at execution time:
TNC OLDCFG.TNC or TNC NEWCFG.TNC for example. Defaults to CONFIG.TNC
if not specified.

The names for files CALLS.TNC, FWD.TNC, LOG.TNC specified in CONFIG.TNC
Installed ke1g improved cbios. Thank you Bill.
Y replaced by YC, YF, YL, switch calls, forward, or log files.
Fixed (I hope) the "Can't DISCONNECT, Link state is..." bug.
Added Z (delete file) to local menu.
X menu item forces forward regardless of hours given in FWD.TNC.
Was not passing "*** LINKED to" thru from next GateWay.
Not allow GateWay connect line with "tran" at end.

     Changes and additions since version 8.6 are:

Fixed (again!) the lack of timeout when bombarded with con req.
Added UA (append) option to local menu.
Fixed dayclock month rollover.
Split EDMSG, FWD, MBFILE as separate routines.

Dear group,

This is my first transmission to the info-hams bunch, hope it gets thru OK.

I took the most recent ARRL prop. bulletin to heart last night, noting it indicated a strong Sporadic E skip condition. Sure enough when I got home after work, channels 2 thru 5 on TV were jumping with a hodgepodge of stations. This was a bit of deja vu for me since I used to be a very active TV DXer during the BIG sunspot peak in the late 50s and early 60s. We lived at that time in an area (San Joaquin Valley of California) where there were no VHF signals at all. I logged 60 stations in 18 states plus 3 Canadian provinces and Mexico, including Mexico City!

Anyway, last night between 6 and 8 p.m. PDT, I logged KATC channel 3 from Lafayette, Louisiana; KFDX channel 3 from Wichita Falls, Texas; and KIII channel 3 from Corpus Christi, Texas. I wasn't able to pull out anything over channels 2, 4, and 5 from LA, altho I caught a snippet of something from Nebraska on channel 2.

I surmised that 10 meters might have a good sporadic E opening, and sure enough, there were some BIG, close-in signals. Between 9 and 10 p.m. local time, I worked Wyoming, Colorado, and Texas, with my 2 watt QRP rig on phone. I worked the same guy in Texas this morning, too, at 6 a.m. local. His signals were 20 over s9 both times!

What I'm leading up to is--are there any other TV DX crazies out there in info-hams land? I'd like to compare notes since it appears we may have some good openings this summer. Any other similar Sporadic E experiences the past few days?

Hope this didn't sound too self-congratulatory, but I was really,

as we used to say, "stoked!" 73--

Without any discussion, I now see that somebody is posting the entire
transactions of the packet radio mailing list onto net.ham-radio
(the first such "digest" was over 30K bytes). This is getting silly.
The reason a mailing list was set up instead of a newsgroup was to
avoid having the lengthy and fairly esoteric discussions about AX.25,
TCP/IP, and similar topics being forced down the throats of net.ham-radio
readers who might not wish to receieve such materials at this time.

Anybody on the nets can subscribe directly to the list if they
are interested in the topic. Posting all of the transactions to
net.ham-radio simply doubles the traffic to the members of the list,
most of whom are already receiving net.ham-radio. This is costing
people REAL MONEY. If there is a massive outcry for all the nitty-
gritty packet radio technical discussions and arguing to be widely
posted, then a separate newsgroup should be used. In that case the
mailing list could be dissolved. But having the mailing list and
then reposting to net.ham-radio is just wasting disk space and money.

Personally, I think that this is a classic case where mailing lists
are superior to newsgroups. But it should be EITHER the mailing
list OR a SEPARATE newsgroup apart from the top-level net.ham-radio.
I would prefer to see the former. But it is extremely wasteful

to do both.

--Lauren--

P.S. Due to other gatewaying that I know is going on, there are
now some groups of people who will receive THREE copies of all
packet radio messages thanks to the most recent "digest" postings.

hr propagation forecast bulletin nr 22 from arrl headquarters newington ct june 3, 1985
to all radio amateurs bt

may was interesting for propagation watchers. the solar flux peaked at 93, one point below the high for the year to date. the low was 68, on may 31 and june 1. the most recent 68 before these came in july, 1976, the first month of cycle 21. with this wide range of flux values, one would expect high levels of geomagnetic activity, but the may average for the a index was only 10.6. this is one of the lowest in the entire cycle to date.

sporadic e skip is increasing markedly on 28 and 50 mhz. this is not yet the high density variety that will make for very short skip later this month, but it brought the 10 and 6 meter bands back to life, as word got around. no 144 mhz skip has been reported yet, but conditions more favorable for this will be showing up later in june, and in july.

the summer e skip is not directly related to high solar flux or sunspot numbers, and the timing cannot be predicted accurately. transatlantic contacts were made fairly often in the low years of cycle 20, mainly in june and july. the most likely time

appeared to be mid morning, eastern time, but evening openings were observed. these would be most favorable for 50 mhz transatlantic work as the european amateurs having 50 mhz permits are mostly restricted to after 2000 hours universal time. 100 british permits have been issued, and at least 25 norwegians now have similar authorization. other countries are likely to be represented as tv is gradually moving to higher frequencies.

american sunspot numbers for may 23 through 29 were between 0 and 27 with a mean of 11.7 ar

x
           New UNIDEN/Bearcat Scanners Announced

     Three new Bearcat scanners  were introduced    at the
     sum-
     mer Consumer Electronics Show in Chicago:

     - BC140   ($139)

     - BC175XL ($229), a keyboard programmable unit with
       full    display,  similar in appearance  to Regency's
       'Z' models.

     - BC50XL ($189), a cost reduced, hand-held  keyboard
       programmable,     featuring 10 channels and a 2 digit
       display.  In a break with the  Bearcat  tradition of
       selectable scan delay on a per-channel basis, this
       model   appears   to have   a 3 second global scan delay
```

which cannot be defeated.

None of these models provides 800 MHz band coverage.

These new models lend credence to the prediction that UNIDEN intends to concentrate on 'back to basics', low cost designs and de-emphasize full featured scanners aimed at more sophisticated radio enthusiasts.

For what it counts I appreciate the chance to view the digest material. If I knew of another way to obtain the material in the digest, I might agree with Lauren; however, as far as I know I can not be on the Packet Radio Mailing List since our site is not on ARPA. If I am wrong please correct me.

I agree that posting the packet "digest" is the wrong thing to do. Clifford@mit-eddie and I have been discussing the creation of a new newsgroup for packet discussions. We have both solicited opinions and as a result of the query, I created net.ham-radio.packet last weekend. Clif is willing to gateway articles between the Arpa mailing list and Usenet.

Unfortunately, due to a netnews snafu here, the new newsgroup probably hasn't gone very far yet.

73, Jim KY2D.

Like I said, anybody can be on the mailing list. In fact, I don't
know why anyone should think they have to be on ARPA to receive
it--the list is almost totally distributed via uucp (I receive
it from ihnp4). So there's no excuse in saying, "I can't receive
the mailing list." But in any case, even if the digest is deemed
a good idea, it should BE IN A SEPARATE NEWSGROUP so that people
already on the list and on net.ham-radio aren't forced to deal
with duplications. And so that the people locked into other
gateways don't have to receive THREE copies of everything.

RADIO TELEPHONES

Bob Parnass, AJ9S

Cellular Car Telephone Frequency Allocations

Cellular car phones operate on paired channels, spaced 30 kHz apart, in the 825.030 - 844.980 and 870.030 - 889.980 MHz ranges. A cell site normally transmits on a frequency 45 MHz higher than it receives.

Conventional Car Telephone Frequency Allocations

In the tables that follow, providers of car phone services are divided into two categories:

1. Telco - landline companies such as Illinois Bell
2. RCC - Radio Common Carriers, or 'independents'

VHF-lo Car Phone Frequencies

User	Channel Designation	Frequency (MHz) Base	Mobile
Telco	ZO	35.26	base + 8 MHz

Post Office Box 205
Holmdel, NJ 07733
201-834-1149 (W)
201-741-1151 (H)
June 5, 1985

Dr. Larry Price, W4RA
President
American Radio Relay League
Post Office Box 2067
Statesboro, GA 30458

Dear Larry:

I have been following the announcement of ARRL's proposal to expand Novice privileges with great interest. I have been a ham for more than 10 years and I, too, am concerned about the lack of growth of amateur radio. Also, as a professional involved with radio technology, I am concerned about the lack of talent entering and exiting learning institutions that train people to do RF work. It is almost impossible to locate quality engineering and technician talent from universities or technical schools. Most students have been drawn into the computer field. I feel that the ARRL proposal, as it appeared in the ARRL Letter, is a good start toward turning this trend around. However, I would like to make some comments and suggest some improvements to the proposal as it appeared in the Letter.

First, the provision allowing Novices to use but not maintain or sponsor voice repeaters is a good one. However, for packet radio stations, near-real-time single-frequency repeaters (digipeaters) are an integral part of mainstream operation. Since maintaining a digipeater requires less skill and knowledge than that needed for a packet station itself, there is no logical reason to deny Novices the privilege of acting as a digipeater. Novices should be allowed to act as digipeaters but not maintain or sponsor Computer Based Message Systems (CBMSs) or other non-real-time repeaters.

Secondly, the power limit for novices at VHF of 25 watts appears to be an excellent choice. But, there are many VHF rigs available in the 30 to 50 watt range. Wouldn't it be simpler for everyone concerned to set the power limit to 60 watts (50 watts + 20%) output, PEP. That would allow Novices to use about 99% of the VHF FM radios in the field. The +3 dB increase will hardly be noticeable since the majority of Novices, like other hams, will use a 10 or 25 watt radio.

Finally, and most controversially, I believe Novices should be given voice and data privileges on 2M. Most important are data privileges. Current packet radio plans call for using 2M for local access and 220 for long haul networking. Denying Novices 2M data privileges will deny them access to packet radio. It is unlikely that many non-Novice stations will

sponsor 10M/1240 MHz to 2M cross-band digipeaters.

Additionally, I feel that 2M voice privileges should be given to Novices. I can't imagine that banishing Novices to 10M SSB/FM or 1240 MHz will allow Novices, as the Letter suggests, "privileges so their numbers can be put to use in performing public service communications." How many NTS nets are there on 1240 MHz? Placing Novices onto these bands will certainly populate those bands but at what expense?

In my mind, one strong reason for retaining the CW requirement was that it almost forces a prospective ham to become involved with another ham or club before getting on the air (if for nothing more than to learn the code). This helps to ensure that the prospective ham will have a support network of experienced hams to help him or her when questions or problems arise. It also ensures that the new hams will be "indoctrinated"

on what constitutes good and bad operating habits. The 10M and 1240 MHz allocations will tend to throw all that preparatory work out the window.

How many mainstream hams are going to get onto 10 M SSB or 1240 MHz FM? If some mainstream privileges are not given to Novices they will, I think, acquire their own style of operating. That may be good or it may be bad. What will it be like on 10 M SSB? I hope 10 M SSB doesn't become another good buddy band and that 1240 MHz doesn't remain dormant.

I don't think the band will actually break if Novices are given 2M privileges. If nothing else, give them access to the lower half of the band. The quicker they are given an opportunity to join mainstream ham radio, the better for ham radio.

Overall, I think the ARRL proposal is a good one and the Executive Committee is to be commended for taking the bull by the horns before the FCC attempts to decide what is best for ham radio. I would appreciate any comments you might offer to my suggestions.

Sincerely,

Paul Newland, ad7i

Can someone tell me whether an Oscar-10 antenna should be right
or left circular polarized? Thanks.

Yes, net.ham-radio is dumped into INFO-HAMS. Thus you've now deluging
people who get INFO-HAMS by arpanet and the PACKET-RADIO list with
two copies of everything.

Has anyone ever found any documentation on EMP-proofing
communications equipment or any other solid-state stuff?

I am considering this not because of nulear war, but
high-altitude nuclear accidents (a real mess generator).

The same theories might also apply to very-close lightning
hits. Hits just short of a complete blow-out.

What good is radio gear if it can't be used in an emergency?

I have been hearing and reading disturbing things about electronic
components simply "wearing out" from use, or circuit designs which
use batteries for volatile ROMs and which will become useless after
some period of time unless deliberately maintained. The former
example includes a recent net.audio posting about the laser assembly
in a CD player having to be replaced after 5 years or so of use, and the
latter includes the control programming for the ICOM (and other brands)
of shortwave receivers and amateur equipment, wherein an on-board
battery must stay alive to keep a ROM programmed to keep the radio in
operable condition.

This troubles me. I had thought that we had a reasonable progression of
development of electronics during these days of solid-state gear
replacing tube equipment that meant longer life for any device. LED's
with essentially eternal lives replaced easily-burned-out incandescent
lamps. Transistors replaced tubes, and ICs and VLSI replaced discrete
components, and, assuming weeding out infant mortality and no actual
damage to the circuit, like overvoltage, it should continue to operate
indefinitely. Dipped caps replaced paper ones, etc.

But now I see that designers either deliberately build in inevitable failures (the use of volatile ROMs and batteries instead of PROMs or other permanent devices) or the solid-state stuff I was led to believe had indefinitely-long lives really is as short-lived as vacuum tubes (the laser diodes mentioned above).

I may be insane, but I really expect electronic equipment to operate forever. I don't want to buy any that has built-in and inevitable failure. I have a lot of old gear, some older than myself, that still works. I expect this tube gear to wear out from heat and voltage stresses but it hasn't yet. If I buy new stuff, without the tube-caused heat and high-voltage stress, I expect it to last longer than I will!

I realize that consumer products have built-in planned obsolescence. I'm not talking about small appliances, which I expect to die and be replaced. I'm talking about multi-hundred-dollar equipment. Am I totally unjustified in expecting such things to be designed to continue to work indefinitely without maintenance, except for mechanical stuff like motors, belts, pots, etc? (I would expect to maintain anything mechanical -- purely electronic gear is different.)

Am I alone in this concern?

Regards,
Will Martin

x
George Chao, a cellular phone user, provided this article, published in the May 1985 'Ameritech Connection' by Ameritech Mobile Communications, Inc. for its Chicago/Gary area

cellular telephone users:

Confidentiality Could Be A Three-Way Street

"One of the differences between cellular service and conventional mobile telephones is that cellular is 'private-like.' Each side of every cellular conversation is assigned its own private radio channel by our computerized system, so there is no operator to go through and there are no party lines to share."

"However, in the last six months, sophisticated electronic scanners able to monitor cellular radio frequencies have become available, and Ameritech Mobile cautions you about conversations of a highly confidential nature held over your mobile telephone."

"Scanners are only able to lock onto one channel at a time and can not simulate our computerized network. In fact, they can ONLY detect one side of the cellular conversation and ONLY for a brief period of time. That's because our computer routinely switches your call from one channel to another to keep the transmission quality of your conversation at a high level as you drive through the cellular service area."

"While scanners are expensive and not routinely used by the general public, be careful in discussing proprietary or very personal issues when using your
mobile telephone. Remember the airwaves are public property."

Don't forget that data saved in FAMOS (Floating Avalanche Metal Oxide Semi)
memories like 2732, 2764, etc is only guaranteed for a mean of 100 years!

I guess I'm thinking of early-sales versions of computer-controlled gear
that were shipped with EPROM instead of real ROM. For example, the first
person in our group who got an H19 got two 2716s, the next got two 2316s
(same pinout hard ROM), the next got one 2732, the next got one 2332 etc.

- Begin Flame -

Please, let's not. The amateur packet radio discussions are *clearly* related
to amateur radio, and should be a subgroup of net.ham-radio. Don't make the
net at large suffer because some are running broken software. Doesn't notes
have an alias feature of some kind anyway? At least the news software
doesn't generate those stupid Orphened response subject lines.

- End Flame -

There, I feel much better now.

From the Orange County Register, 5-29-85:

     "Statistics turned up by Dr. Samuel Milham Jr., an
     epidemiologist for Washington state, suggest that
     ham radio operators may be nearly twice as prone
     to leukemia as the rest of the population.

Reporting in The Lancet, Milham presented the results
of a survey of more than 1,900 amateur radio operators
in Washington and California who died from 1971 to 1983.

From dead certificates, he discovered that 24 of 1,691
subjects had died from various types of leukemia. The
expected number of leukemia victims in a suitably
matched control group would have been 12.6."

As mentioned, Motorola, GE, RCA and maybe Johnson, are the best choices.
The two low-cost brands mentioned in the original posting are the ones
he gags at, not the MOT, GE, etc. Sorry if it wasn't clear.

I don't think anything lasts forever. The "forever" LEDs that were mentioned
in the above article also wear out after a given amount of use. Fortunately
this is about 250,000 hours (~30 years), longer than most people
would keep something (except radio amateurs. :-)). I would assume
the CD laser life is rated in hours also, with 5 years probably being
the "average" based on some study of how often Joe Average uses his.
Losing all programmability when a battery goes dead does sound like
a design flaw. As far as I know my Yaesu 2M only loses its memory
when the battery goes. But I sure like the feature that I can turn off
the radio without losing the memory, so it seems like a small price
to pay.

You also have to remember that manufacturers make a tradeoff between
reliability and cost, with cost usually being much more important
to the manufacturer. A part that lasts longer may be significantly
more expensive, especially when talking in millions of units. When
it comes to the bottom line, the cheaper part wins.

If anyone has advice on working Iceland I would certainly appreciate
hearing from them. I'm running a Ten Tec Argosy (50 watts) with assorted
wire antennas. Thanks and happy hunting - don't forget Field Day,
June 22-23 starting 1800 local.

The laser diodes used in CD players (780 nm) are typically rated

at "over 5000 hours" use. Those little devils generate a considerable
amount of energy from a tiny chip area. As they age, they require
more and more current to generate the required amount of light, and
circuitry in the player automatically keeps the current high enough
to provide this level. Eventually, the diode simply won't emit
enough light without so much current that it burns out.

This isn't part of some devious plot--it's just the physics of
the little beasties.

Your first problem is to disconnect or surge suppress all antennae,

like, THE antenna, the power cord.

Then you screen all openings in the cabinet.

Then you surge suppress all the internal antennae, like every
conductor over a few inches long.

OR, you can revert to valve equipment, or as we yanks call 'em
tubes.

About 1980 or so, one of the Ham Magazines had an article dealing with
surviving the bang. It dealt with how to protect your radios so that
they would be functional after the pulse. I agree that protection from
use in confrontation is probably futile, as you won't be dealing with
just one bang but maybe 10 or 20 bangs spaced minutes apart for each
major target, but for an accident it might be a good idea. I don't
have the article but they presented the idea that it was pretty futile
and the only safe bet was to keep a "backup" rig in a shielded metal
box if it was solid state. Tube equipment may survive if you took some
of their precautions.

I own one of those amateur radio devices (actually a Kenwood). After
five years or so, when the battery goes dead, I do not intend to
pay out several hundred dollars to replace the radio. I plan to pay
two dollars and replace the battery. It's just a little lithium
cell that keeps the 4-bit CMOS uC alive when the radio is turned off.
(Actually it isn't even necessary except that you'd have to reprogram
the radio everytime you changed out the ni-cads to another battery pack).
Other uses (like terminal baud rate storage, etc) would be similar.
It may be a pain to waste several minutes every 5 years to reprogram
whatever the battery went out in, but then ...

hr crrl bulletin nr 20 from crrl headquarters
london, ont june 7, 1985
to all radio amateurs bt

doc has accepted a crrl proposal that a committee of amateurs, to be named by crrl and carf, review all applications for special prefixes before they are issued by doc. the committee will likely have 4 to 6 members, and should be operational by september.

the 1985 crrl repeater directory is now available. crrl members should send an sase to crrl, box 7009, station e, london, ontario n5y 4j9 for a copy.

nominations are now open for crrl amateur of the year. send your nomination, with supporting documentation, to the crrl address above.

the crrl board of directors will hold its annual meeting in toronto on july 13. anyone with input for this meeting should contact the nearest elected member of the crrl board, ve1asj, ve2ij, ve3cdm, ve3fn, ve3gro, ve6abc or ve7csd ar

qst de k9eui
hr propagation forecast bulletin nr 23 from arrl headquarters
newington ct june 9, 1985

to all radio amateurs bt

the solar flux numbers for may 30 through june 9 were almost identical to those for may 2 through 12. telescopic observation of the sun also showed very similar sunspot activity to that seen four weeks earlier. this is of interest because active areas have not lasted that long in recent months. if this trend continues we should see flux values in the 80s and 90s through about june 20, with a return to lower numbers later in the month.

the practical effects of the higher solar activity vary with the frequencies used. shorter skip can be expected on our lower bands and the dx potential of 14, 21 and 28 mhz will improve somewhat over that observed with the flux in the high 60s and low 70s earlier this year. the influence of higher flux and sunspot numbers is muted in the summer months however, as sporadic e layer ionization reaches its peak in late june. e skip becomes the dominant mode on 21, 28 and 50 mhz for the next few weeks and the effects are not directly related to sunspot numbers or the solar flux. they peak in late june, taper off in july, and disappear almost completely after early august, when the f layer takes over again for the fall and winter months.

as to current conditions, a long period of near quiet magnetic field ended with a geomagnetic storm june 7 to 9. the k index was rising again sunday evening, and a major aurora enlivened the closing hours of the arrl june vhf contest, around 2300 utc on june 9th.

american sunspot numbers for may 30 through june 5 were between 0 and 27 with a mean of 9.6 ar

I am also concerned by some of what was said concerning products wearing out.
I don't know anything about CD's but I do find the ICOM battery problem
totally ridiculous! My Kenwood 930 has a backup battery but the only thing
it is for is to hold whatever the user puts in memory. The same is true of
my Azden PCS-2000 and my 2 meter handheld. The idea of a unit loosing some
of its essential operating software when a battery runs down is disgusting
(but then I have never been an ICOM fan anyway).

Also:
        - what frequencies they used,
        - what power they ran,
        - and for how long.

The E&M field is not the only thing that might account for a higher
rate of Leukemia in hams and electrical workers. There are many
toxic substances associated with electrical and electronic equipment.
In particular, PCBs were used as "transformer oil" in power distribution
transformers for many years. Fifteen years ago, every other QST had
a story from a ham who was given a free gallon of oil (i.e. PCBs) for
his Cantenna by a local supplier who did not deal with orders smaller
than a 55 gallon drum.

In the early 50's, we fairly frequently received Cuban TV on channel 2 in
central Kentucky. We had a fairly elaborate antenna system since, at that time,
the closest stations were in Louisville and Cincinnati (about 100 miles away).
As a 7 or 8 year old kid, the only programming I remember was a Shell oil
commercial featuring scantilly clad dancing girls singing in Spanish (This was
before Castro).

I think KLM offers a log periodic or two. The "problem" with log
periodics is that they trade gain for bandwidth. A properly designed
monoband yagi will have better gain than a multi-band log periodic.
From numbers that I've seen, a tribander will give more gain for a
given boom length than a log periodic (these were manufacturers gain
figures, not to be taken too seriously). The only advantage I can
come up with for the log periodic is that it will cover the WARC bands.
Log periodics also have disadvantages in that all the elements must
be insulated from the boom, split, and fed.

I would go with the monobanders, or a good tribander before I would
go to a log periodic.

              Paul Young, K1XM

Can someone tell me why people are loading down this group/list
with this information when it is easily available by other sources?
If we are going to persist in having SWL fanatics and Scanner Freaks
on the Hams list, I think they should narrow their postings to things
that are of interest but not generally available otherwise. There is
no need to type in all the NAVAID frequencies when a much better references
are available through NOAA.

A local ham here has had monobanders on 10, 15 and 20 for some time, but he
was unable to solve the interaction problems. He now has a KLM KT-34XA, and
he claims his new antenna has better gain, f/b, and of course no interation
problems. -Mike

I have another question on that study.... (FLAME ON)

Is 1600 some odd hams, and only 24 people who were affected REALLY statistically significant? I guess in order to really believe the results, it would have been nice to have been done on a much wider range of people. (I am not one of those who believes everything that they read, even if it IS in a medical journal.)

As far as I know, RF has also been linked to other things, including cataracts in the eyes (if the exposure is excessive), headaches, and skin burning effects. But with only 24 people (as opposed to 12.6 for a control group) I am skeptical. It is possible that the other 11.4 people were careless, affected by the water in that area, etc.

We are all aware that there is some hazards in this hobby, with cautions about high voltages, possible problems with lightening, etc., in the study material when we go for our licenses. I guess I'm not too worried at this time that my hobby poses a significant risk to my health. If we are really going to paranoid, how about cleaning up the water supplies, the air we breathe, and the food we eat (not to mention damage done by cigarettes, PCBs in DUMMY LOADS, etc.). I'm sure we could go on and on, but that's not the point.

(FLAME OFF)

I am interested in purchasing some satellite equipment soon. My interests lie initially with listening to oscar 10,11, but I will eventually want to transmit also. My question is:

what equipment is worth considering?

  I don't want to spend a large amount of money, so I was considering
the TEN TEC 2510(b) which (I believe) is a 2M -> 10M converter and
a multimode 440Mhz transmitter. Does anyone have any information
about it?

  Are there any recommendations for antennae, rotors, preamps?
Any help would be greatly appreciated. Thanks.

Re: LF aeronautical beacons on net

I think this info is great and I find it interesting. I tolerate the
packet radio stuff and a lot of other stuff that is not interesting.
Ham radio consists of about 50 separate hobbies wrapped into one. You
cannot expect just those things that interest you to be posted.

Keep up the frequency lists. I can use them.

It's not frequency lists in general that bother me, it's stuff that is
so routinely available elsewere. It would have been better to post a
reference, if something was going to be posted. Bob Parnass, the king
of such postings, always publishes stuff that is unusual or not generally
obvious. The list I was complaining about is in the same vein as listing
all the AM broadcast stations in the State of Illinois. A little discretion
in posting can keep the entire list from wallowing in needless messages.

I disagree. I have very few sources of information available to me and enjoy
hearing all the good stuff. Besides, I am basically anti-sensorship.

   I need operating and/or service manuals for a Singer PanoramicPanalyzor Model
SB-12bs Type T-100 spectrum analyzer. The company
wants $150 just for Xerox copies, so my wallet will appreciate any
help. I also have what I think is a prescaler for it, model RF-7a,
and could use any information on that, too. Many thanks.

Anybody know of any good study guides for the Extra exam???

I've been inactive for the past 8 or 9 years, and looking over
some of the questions on the local VE's list, I have * A L O T *
of catching up to do!!!

Thanks in advance,

Vince, WB7TXP @ ITT Raleigh

An acquaintance of mine suggests another reason for higher leukemia
rates among hams: Many hams get into the hobby late in life or after
disability of some kind. It could well be that the overall health of
hams is poorer than the general population.

Just thought I'd second Bob Parnass' pointer to Newkirk's new "Enjoying Radio" publication. I was going to hold off on a real recommendation until I see another issue or two, just to insure that it is viable enough to last for at least the initial year's subscription, but I did find the first issue interesting. One slight quibble -- it is printed in "reverse format", so the pages open to the left, like a Chinese book, ostensibly to provide space for hole-punching to keep it in a binder, but the margins are too small for hole-punching in my opinion.

Another new publication is Radio Equipment Review. This is designed to be a successor to the old San Diego DXers Club newsletter, which disappeared when Larry Brookwell, who ran the SDDXC as sort of a one-man operation, died. That newsletter always emphasized equipment news and evaluations. This new publication is designed to continue in that tradition. I've sent it an edited compilation of some of the stuff I've posted here on portable receivers, for use in a future issue. The first issue of RER was mainly devoted to the Icom R-71A. It is available for $2 per issue, up to a 6-issue-subscription (for example, I sent $6 for the first three issues). Address:
Radio Equipment Review
Ronald Pokatiloff
2661 Sheridan Road
Zion, IL 60099
(312) 872-3633

Another product Mr. Pokatiloff is putting out is a Commodore 64 program which contains a comprehensive schedule of English-language shortwave broadcasts for the 2300-0700 GMT period. The program, on cassette, is $15, and a printout of the output is $5.

Regards,
Will Martin

I'm looking for a discount source for a 800w-2200w gasoline
powered AC generator. Preferrably a Honda.

I've looked around the SF Bay area and have found that
there are an enormous number of styles and types.

The best thing about a discount mail-order place
would be the a) Price and b) no state sales tax.

Any ideas??

I appreciate comments I have seen on frequency lists. This is the second time that I have posted the Midwest Aeronautical Beacon list. The last time was at least 2 years ago and there have been some changes.

Perhaps pilots have an easier time getting this kind of info than I thought (I know they are on the maps). I remember trying to find a listing of the marine beacons on Lake Michigan for a friend and even stopped in at the Coast Guard station in Ludington, Mi. and they didn't even know what frequency their beacon was on, let alone any others!

Some time back, it was proposed that a separate "SWL" newsgroup be started, to keep this group strictly for hams. I think I agree with what the majority said, that there was not all that much traffic here and occasional lists would not clog the system up.

I have had my Kenwood 2500 HT for 3 years and the original nicad just developed a shorted cell. An exact replacement cell is made by G.E. and has a part number of GCL450ST 48F224. The pack is easy to open. Just stick a pointed object into the 2 holes on top and press down on the plastic tabs inside, then pry open, separating the 2 halves.

I have thought many times of attempting to get my IC02AT to cover
a larger frequency range primarily to recieve the NOAA weather forcast.
I have tried to get a service manual from Icom America without too much
luck. Has anyone else gotten one? Ok so I got adventursome and opened
up the little monster after it losts its memory in cold weather. Pushing
the reset switch fixed that by the way. After finding the diodes used
to program the band plan I decided to quit rather than destroying the
thing as the diodes were acutally surface mounted transistors. While I
am pretty well equiped to work on small circuits I don't have much
experience with SMC's.

Has anyone been more adventursome than myself and would you like to share?

qst de k9eui
hr dx bulletin nr 19 from arrl headquarters
newington ct may 17 1985
to all radio amateurs bt

special prefix, sweden. the swedish amateur radio association is celebrating its 60th anniversary during may with the use of the special prefix 7s, in place of the normal sv prefix. work all eight swedish districts and receive an award from the ssa. qsl cards are not necessary.

special prefix, australia. to celebrate the 75th anniversary of the wireless institute of australia, australian amateurs may use the prefix vi through the end of the year. a special station, vk75a, will also be active.

jordan. kevin, jy9wr, is currently very active on 20, 40 and 80 meter cw around his sunrise. qsl to g4ats. kevin plans 160 meter operation later this month.

crete. frank, dl7ft, is visiting crete and signing dl7ft/sv9. his operation will be ssb only, on 80 through 10 meters. qsl to his callbook address, in the 1985 callbook only. also, hal, w0pu/sv9, is using his new callsign, sv0dv/9, and plans to erect a new antenna for the low bands at his new qth. qsl to wb4tdh.

guernsey. a group of belgian hams is visiting guernsey, signing gu0 followed by their home callsigns. the group has been reported on 160 through 15 meters in north america. qsl all calls to on7jf.

antigua. a group from the north jersey dx association is on their annual outing to the caribbean, this time signing v2a on cw and w2jt/v2a on ssb. operation is from two separate sites. qsl to the w2 qsl bureau.

cocos island qsls. wb4ubd is qsl manager for the february 1985 ti9tty dxpedition only. ti9j qsls go via ti2j.

franz josef land. val, uw3hy/1 reports that ua1ot has left the island and returned to the mainland. uw3hy plans to remain on fjl until at least the end of the summer. he reports there is

no word on replacement operators. also active from fjl is the club station, rz1owa. please note that rz1owb is not located in franz josed land.

israel. watch for special event station 4x85wse on 20 and 15 meter cw.

wpx contest. dont forget the cq wpx cw contest on may 25 and 26. several stations are already using special prefixes in anticipation of that weekend.

propagation. 10 and 15 meter propagation has been sporadically good over the last several days. north american stations report having worked western europe as late as 0200z on 15 meters. as the summer progresses, conditions may continue to improve.

china. by1pk was reported very active in last weekends cqm russian contest, handing out numbers over 700. in the u.s., this station was copied from 1130 to almost 1700z over the north pole.

djibouti. dany, j28ei, has been active on 40, 80 and 160 meter cw only. watch for him at his sunrisa peak, around 0230z, on 1836 khz. qsl to fc1jen or direct to box 2417, djibouti.

rhodes. although he does not sign /sv5, sv0ah is located at the voice of america in rhodes. watch for him around 2100 to 0230z on 40 meter cw ar

This is a question that's bugged me for some time.

Those of us who are space junkies have gotten used to listening to space-to-ground audio links that are, shall we say, somewhat less than "telephone quality". While the overall intelligibility has gotten better over the years, it is still worse than I would expect.

In the case of the space shuttle, which uses digital transmission (delta mod) for its primary (non-UHF) audio links, I had assumed that the noise you hear when an astronaut opens his mike must be due to things like ventilating fans on board (after all, air doesn't move by convection without gravity).

However, when Owen Garriott made his famous DX-pedition, using the same headset connected to a 2m FM handie-talkie, his audio quality was absolutely clear -- virtually no transmitted noise or distortion. If I hadn't already been familiar with his voice from things like interviews and press conferences, I would have suspected a hoax. So where does all the noise come from in the NASA chain? Do the orbiter avionics use large amounts of speech compression or clipping, or what? Should we hams offer to replace all of their communications gear?

Phil

I am in need of some capacitors with 6Kv ratings. I need two each of 500pf, .001, and .03. Any ideas? I've already tried all the local distributors, and even called the Sprague factory. They offered to make them up special for lots of money.

Please reply by mail.

I'm sure everyone who reads this group has opened up a telephone to see what's going on inside. No, I'm not writing about the new high-tech single-piece electonic pulse phones, I mean the good old all-American Western Electric black rotary dial desk phone. The kind that hard-wired to a wall junction block (called a 42A) with three or four wires (third was ground and fourth was lamp supply for lighted sets which used an accessory transformer hiding somewhere in your cellar). I believe it is called a "model 500" set or something. The guts of this phone are still used in 5-line with hold systems and also with DTMF dialing desk sets from W-E.

The large coil block riveted in the base which I believe is called the "network" has about fifty screw terminals and has got to be one of the most confusing pieces ever invented. In the first place, this thing is labelled with numbers and letters most of which are meaningless unless you are an installer. Half of the terminals are jumpered to others underneath where you can't see and the others connect to coil windings and ....caps?? Anyway, this network thing is filled with thick sticky goop either to keep people like myself out of it or to seal it from moisture.

The other strangeness in this phone is the number of contacts used in the "hook switch". This switch must be a million-pole double-throw. It seems that the only things that would be needed to be switched are the network (completely out of circuit) and the bell with it's series cap (in circuit) when the phone is "on-hook" and vice-versa for "off-hook". Sounds as if a SPDT switch would do just fine or maybe a DPDT if you need contacts for a dial lamp.

Now that all of the phone stuff is deregulated, none of this must be top-secret anymore. Does anyone know where I can get the training manuals that they teach the installers from? Those guys amaze me when they open up these phones and actually figure out how do anything they want to with them. Also, where do all of these new modular jack numbers come from (RJ-11, RJ-35, etc.) ? Is there a committee somewhere dreaming these up and do they relate to ANYTHING? Comments appreciated.

Re: Wiring

It's rather difficult to send out schematic diagrams to a network of people
using regular old ascii terminals, but since wiring inside most fones is
pretty standard, a description should do the trick. This applies to *all*
WE phones and ITT phones that use the standard dial/ringer/network block/
handset configuration. I've rebuilt lots of these suckers, and can
confidently say that they're all the same.

Everything basically talks to the network block. The network block contains
the ringer capacitor, the induction coil that handles the handset, and very
little else save some spare screw terminals. Left to itself, the network
block can function as a standard line load [it looks electrically like a
phone] when a line is connected across RR and C. These are the inputs to
the coil. The ringing capacitor is indeed across A and K as someone mentioned.
In addition, older blocks have a smaller capacitor across F and RR, to
decrease sparking across rotary dial contacts.

Handset:
Green and White: Earpiece leads. These connect to net R and GN respectively.

Black and Red: Mike leads. Connect to net B and R respectively.

Ringer [two-winding]:
Black and Red: To line. Connect to L1 and L2 [or whever your line comes in].
Grey and Grey/red [these may vary; they are the ''other two'' wires, anyway]:
     Connect to net A and K. The circuit thus formed runs from one side
     of the line to one ringer winding, thru the A-K cap, thru the other
     ringer winding, to the other side of the line. This configuration
     has infinite DC resistance, but picks up the AC ring voltage.
Ringer [one-winding, rare]: Connect the single winding [two wired] in
     series with the A-K capacitor somehow, and this whole thing across
     the line as above.

Rotary dial:
Blue and Green: Interruptor. Connect to net F and RR.
White [2]: Earpiece suppress. Connect to net B and GN if desired.

Touch-tone dial:
Green: + Line in. Connect to net F.
Black: + Line out. Connect to net RR.
Org/Blk: - Line in. Connect to net C.
Red/Grn: output common. Connect to net R.
Blue: output. Connect to net B.
*Note: the above 5 connections will give you a ''bare-bones'' dial
configuration without features. Features are mike disconnect, earpiece
suppress, etc which are done simply by routing leads to these through the
extra contacts on the dial instead of directly. If you want the features,
modify the wiring as follows. If your network block doesn't have the S and
T terminals, you have an old one designed for rotary dials, and you'll have to
do kludges.
Earpiece mute:
Move Handset lead at White to net S. Also connect Dial White-Blue to net S.
Connect Dial White to net GN. This routes the earpiece through
the dial switching mechanism which resistifies the circuit on button press.
Mike disable:
Move Handset Red to T. Also connect Dial Red to T. This completely disables
the mike on button press. Make sure Dial Red-Green is connected to R if you
do this mod!

Hookswitch:
You'll find many variants of this in different units; some configurations
switch both sides of the line, some only one, some switch out the ringer
when off-hook [which isn't necessary, really]. The following should work:
Yellow: Connect to net L2. This is where the line enters.
Brown: Connect to net C.
Green: Connect to net L1. This is the other side of the line.
White: Connect to F. This is switched line power to the dial and the rest.
Red: Connect to R. This, with Black, is shorting earpiece mute.
Black: Connect to GN.

Line in:
Green and Red connect to L1 and L2. Try one polarity; if the touchtone dial
doesn't work, then flip them. Rotary dials, of course, don't matter.

If someone sees errors in this, please notify the list with the correction...

This is a pointer to a source of data from the US government.

If you need a geographic locations data base, including names, latitudes, longitudes, elevations, etc., don't do what I did, which was gather it from atlases. Instead, you can order an incredible quantity and quality of such data from the United States Geological Survey (USGS) National Cartographic Information Center (NCIC). They've digitized from best available maps the name, location, type, etc. for just about every named node, line, or area in the entire country. There are thousands of entries for each State.

Unfortunately, they don't advertise themselves very well. It took several years of occasional calls, letters, and library visits to stumble over the information below. Even the local USGS office did not know about the computer mapping project. To get straight information you should contact the central office:

> Geographic Names Information Management
> National Center, Stop 523
> 12201 Sunrise Valley Drive
> Reston, Virginia 22092
>
> 703-860-6262

From this source you can get a couple of handouts which describe the data available. You can get each State's data in the form of:

> * Mag tape $75

    * Printed book(s) $29
    * Microfiche ..... $ 2

For example, the Colorado printout (which I happened upon at a
library) is two volumes, totalling about four inches thick, entitled:

    Colorado Geographic Names Alphabetical Finding List (917.88)

Please contact them for more information.

Some of the noise on the air to ground is due to marginal conditions getting into the ground stations. (On the last STS, I could tell how close to LOS/AOS the shuttle was by the signal/noise ratio on the air to ground). Some ground stations seem to be very good (TDRS is pretty good, the Indonesia/Australia ground stations are pretty bad).

A lot of this is due to the telephone links from the remote sites to Goddard, which are highly variable it seems.

Summary: Radio equipment in spacecraft

A good question, and an opening for a topic I had been meaning to post for some time now, and always forgot to...

What has the radio equipment available to the astronauts been, over the history of the manned-spaceflight program, and especially now, in the Shuttle? As a longtime DXer, I have always wondered what it would be like to have radios in orbit, and be able to tune around and see what I get. Can the astronauts do this?

I would expect that you'd get some shortwave and medium wave signals --
the portion that punched through the ionosphere and wasn't reflected,
and that part radiated straight up, which doesn't get reflected, as
you pass over those antennae. Higher frequencies would go right through
the ionosphere, of course, but I'd expect to get a mixture of everything
on the hemisphere transmitting on that particular frequency (with the
closer transmitters dominating, so it would constantly change as the
receiver orbits).

So, do the astronauts now have general-coverage receivers that they can
tune, or is all the radio gear fixed-frequency and dedicated to the
mission? What about video reception? Do they have PAL and SECAM and
NTSC equipment to look at TV signals from all over the world as they orbit?
I like to think of getting a mix of every US station on channel 5 at
the same time... surrealistic TV DX!

The latest episode of the PBS "Spaceflight" series mentioned how
deadly bored the Gemini astronauts were during scheduled sleeptimes
(when they weren't sleepy) and during the last part of long-endurance
missions. I DX at times like those -- did they have the chance to?

What about antennae? Spacecraft being metal cans, it probably is
necessary to get some sort of antennae outside the craft and the
signal fed through. Are there spare or unused antennae that can be
used for recreational radio reception? What about HF -- are there
reeled-out longwire antennae on the Shuttle for HF, or is that
portion of the spectrum ignored? (Could you receive LF or VLF
from orbit, or are those all ground-hugging signals?)

Any NASA types out there who have info on the the radio-related
aspects of the space program, please post info on this! Inquiring
minds want to know!

Regards,
Will Martin

I recently put up a Heathkit HD-4040 TNC as WA1OMM in Nashua, NH.
I am a local user of the W0RLI Packet BBS in Westford, MA. I would be
interested in hearing from anyone using the Heathkit TNC with comments
about it. Are there any quirks or patches? How can I have messages stored
in RAM for later retrieval? Any help would be appreciated.

73   Paul - WA1OMM

<><><>
I am soliciting advice and comments on the following. I live in a fringe
area for most of the good FM stations that broadcast from Chicago. I can
receive these broadcasts easily on my radio that connects to my TV antenna,
but clock radios and walkmans get little or nothing.

I think what I need is a limited area FM transmitter so that I can use my
walkman while out on the tractor. It's a two hour job to mow and I sure
would like to listen to the radio (note: radio, not tapes!). I'd also like
my other radios playing my choice of music which includes other FM stations,
discs, or reel tapes from the stereo. Here is my wish-list:

    *) stereo hi-Z audio inputs
    *) range of about 500' radius (is this legal?)
    *) signalling input; i.e. maybe I can detect a phone ringing

or some other signal and 'beep' my remote radio.

I sure would appreciate any pointers on available equipment, legal req's, similar experience, how-would-you-do-its, and any other comments. Please try to mail to me, even if you post a followup.

QUOTREK STOCK MARKET QUOTES TRANSMITTED
ON FM SUBCARRIERS

QuoTrek is a subscription service in which stock quotes are transmitted, without the standard 15 minute delay, on the subcarriers of commercial FM broadcast stations. Dataspeed, Incorporated provides this service, in which subscribers use a portable radio terminal, resembling a combination Sony Watchman TV/pocket calculator, to receive up-to-the-minute stock market prices.

With expansion planned to other cities, Dataspeed sales literature claims that QuoTrek digital stock information is currently transmitted on a subcarrier by these stations:

Sounds like you need to connect the headphone output jack of your indoor receiver (the one that can hear the stations you want) to the input connection of a "Mr. Microphone" or some other type FM wireless microphone. Radio Shack sells a kiddie's toy for $6.95 [#60-2109], but I don't know its transmission range. The catalog also lists a "Wireless FM Mini Tie-Clip Mike" for $19.95 [#33-1076], but the range is specified as 250 feet outdoors. This scheme only provides you with monaural reception.

I've used a wireless intercom on 200 kHz for a local area relay from the livingroom to the bedroom rather than running wires.

If you're not fussy about fidelity, you could use a pair of toy 49 MHz walkie-talkies, dedicating one to full time transmission, and one for reception. You'll have to contend with nearby cordless telephones on the same frequency. The latest John J Meshna catalog1 lists a 49.86 MHz walkie-talkie board on page 56 for $1.50 [H41A-26].

I've noticed quite a lot of packet related traffic on the net and thought
I'd just toss out this question to be commented on by you folks in
net land.

Should there be a packet radio subnet, maybe with official mailing list
or equivalent?

Here's the scenario - I am using a Heathkit TNC and a Commodore 64.
I connect the 64 to the TNC via an MSD RS232 interface and a straight-
through RS232 cable (pins 1-8 and 20). Terminal parameters are set
correctly, however I cannot receive anything on my screen. What is sent
seems to make it to the TNC since my my PTT light turns on.

Another computer with a real RS232 output works just fine. Heathkit says
they tested the TNC with a 64 using the Commodore 1012A RS232 adapter.
So, could it be that the MSD is not quite the same as the Commodore
adapter? Is anyone using a Commodore with an MSD RS232 interface?

Please advise. I can be contacted through the W0RLI PBBS in Westford, MA.

The list price of the 1985 World Radio TV Handbook is $19.50, which is
far too much. I always order my copies by mail from Century Print Shop
in California, which sells them for a reasonable discount, especially
if you order in advance. Ordering after-the-fact, as you would now, you
don't get that much of a discount. I'll have to look up the cost and
address at home tonight and message you tomorrow about that.

Actually, though, I *don't* recommend you buy the 1985 issue now, unless
you really want it and have looked at it already and are convinced that

you need it. You see, the WRTH is prepared around the end of the year, with station schedules and frequency lists valid at that time, and with info for most broadcasters about their next schedule period, which ends in the summer. So buying it now, you are getting info which will become obsolete very shortly, yet are paying full price anyway. I always figured that if you couldn't order in advance, so you get the WRTH as soon as it is initially distributed, you were not getting your money's worth. It should be being sold for at least 33% off by now, and drop down to half-price or less as soon as the schedules listed in it are superseded. Around September or October, it should be closed out for a dollar or two.

This is only my personal opinion, but it is how I view the value of this sort of time-dependent data. The only things you'll find of value in the WRTH after the schedule listings are superseded are:

a) info on stations who do NOT change their schedules, like medium wave & TV, and

b) station addresses, interval signals, and technical information, and

c) the receiver reviews and articles in the back.

I buy this thing every year out of habit, mostly, read the back section when I get it, and stick it on the shelf. If I refer to it 10 times a year, I'd be surprised. I know that other people refer to it constantly, so this is just personal, but I wanted to point out that it is not a vitally necessary resource for every SWL. I get MUCH more out of a subscription to Review of International Broadcasting than out of the WRTH.

Regards,
Will Martin

Okay on the NOVRAM. I haven't had any problem with that. As a matter of fact the thing went together, calibrated, and ran by the book. I haven't tried any of the other baud rates. I am running 1200 baud on 145.01 using an Epson Geneva lap computer for control. As soon as I figure out my RS232 problem, I'll put it on the 64 with the monitor and virtual disk storage. Heathkit has informed me that the HA4040 was tested with a 64 using the Commodore 1012A RS232 interface and a straight-through RS232 cable with pins 1-8 and 20 active. So, I can only assume that the MSD interface is not quite Commodore capatible for all pinouts. Heath also informed me that a technical data sheet is available for putting together the filter for using the TNC on Oscar and HF. Apparently there is no special 300 baud modem kit as identified in the catalog. Its merely a different filter that plugs in. Also, the 6264 8K RAM is the only additional RAM that can be supported for a total of 16K (only 10K total for storage). The spec I believe mentions 16K for a total of 24K, but that is incorrect. The extra RAM is available as KIT # ETA-18-6 for $24.95 from Heath. I am sure you can get that RAM elsewhere for much less!

Summary: Possible source

One possible source for manuals for "professional" or industrial/non-consumer electronic equipment, when the originating company either is defunct or, as in this case, wants an outrageous price, might be some of the dealers in reconditioned and used electronic gear. The primary one of these that I know of is Tucker Electronics Co. (PO Box 461060, Garland, TX 75046 -- 800-527-4642* or (214) 348-8800). I've seen Singer spectrum analyzers and RFI/EMI gear in their catalogs; they might carry extra sets of manuals or be willing to Xerox some for less than the originating company would charge.

Even if they don't have the manuals, they put out a catalog with all sorts of neato stuff in it; I've always wanted to DX with some of those $30,000 surveillance and RFI/EMI test receivers and spectrum analyzers....

Regards,
Will Martin

I don't know, but 20 MHz is an awfully big shift. You'd better be pretty
close to the transmitter, or willing to retune your radio away from the
ham bands. Why not go down to radio shock and by a weatherradio.

1). Has anyone but myself noticed the audio tone quality that commercial
mobile FM gear has? Unlike your typical "police scanner" or even
mass-produced FM amateur radios which have a high pitched hiss when you

disable the squelch, commercial sets have a throaty sounding hiss and the voice quality is always pleasant, not buzzy. I have tried building audio filters to change the tone for my 2m gear but all I get is muffled audio. External speakers help a bit but I am convinced that they are doing something sneaky inside of the commercial stuff.

2). 6 meter questions:
    I am young enough to have missed the heyday of 6m popularity. Does anyone still produce it for hams? Should I build my own or modify a Motrac or something? How bad were the TVI problems from equipment used strictly car-to-car in rural areas? What kind of range advantage can I expect over 2m mobile-to-mobile? All I want are one or two freqs. Were there any "popular" ones like 146.520 simplex(2m) ?

  Does anyone have any good or bad comments concerning the Regency HX-1000 pocket scanner?
  At last, it seems like the chassis voltage of this set is actually set up for use with a NiCad pack (Many other pocket scanners and tape recorders are set up for carbon-zinc cells. You know the problem....When you go to use NiCads you start with a volt or two less from a fresh pack using the same number of cells). Thanks for any comments before I buy.

These numbers are the Universal Service Ordering Code (USOC). I don't know who assigns them, but a reference to them, including all connections, is available in the FCC Rules and Regulations, Part 68 (Telephone Interconnect).

Part 68 is a good reference for anyone interested in telephones. I bought my copy at our local Government Printing Office bookstore. The price was around $5.

qst de k9eui
hr propagation forecast bulletin nr 20 from arrl headquarters
newington ct may 19, 1985
to all radio amateurs bt

for the first time in several months, there were three sizable

sunspot groups visible may 18 and 19. the solar flux reached 93 on the 16th, dropped back to 90 the next day, and was down to 88 by the 19th. the large group responsible for the 90 peak on may 10 went around the west limb on the 20th. it appeared to be shrinking and the two groups now in the eastern portion do not appear large enough to sustain flux values in the high 80s very long. the area of the sun that started a major flux rise on april 20 is back again, but thus far has not shown anything like its april vitality. a return to flux readings in the low 70s does not appear as an immediate prospect, but it could happen late in may.

a decline in average geomagnetic activity below the late april peaks is expected to help propagation prospects during the balance of may. the normal 27 day interval for recurrence of the major disturbance of april 21 has already passed. indications are for fairly good conditions through may 22, with recurrent disturbances may 23 to 26. these will degrade east west communication in the higher latitudes mainly. sporadic e skip was more prevalent last week. it will come more often with increased effect in late may. it will enliven the 10 and 6 meter bands with short skip increasingly through late june and the chances for 2 meter skip will improve.

american sunspot numbers for may 9 through 15 were between 43 and 21 with a mean of 29.7 ar

I'm looking for recommendations or caveats regarding the 2-meter
repeater packages currently offered. Our group is looking at the
systems offered by Spectrum and Micro Control Products (MK4, MK4 etc.).
Since we are faced with spending about $3K, we need any comments

you would like to make.

Please MAIL replies to: {uw-beaver, microsoft}!fluke!wavetek!john

x
> I was hoping to get the answer to this from the context of your
> loggings, but no luck. What is a "bootlegger" in a 1985 context? (I
> assume that these people are not making corn liquor out in the woods.)

I use the term 'bootlegger' to describe someone who engages
in 2-way radio conversations without being properly licensed
for the frequency being used. This is distinguished
from
'pirates', who are also unlicensed, but make one way broad-
casts.

Many bootleggers are radio hobbyists that can't (or haven't
tried to) obtain an amateur radio license, and have migrated
out of the Citizens Band. These people first started
operating illegally just above the highest allocated CB
channel, sometimes straying into the bottom of the 10 meter
ham band (28.0 MHz). More recently, the most brazen
have
been heard in the 6.5 - 7.0 MHz range. I've been monitoring
the same guys for a few days now. As I type, they've
just
started a conversation on 6.933 MHz LSB (lower sideband).

Other bootleggers are drug smugglers. Many of their Spanish language conversations can be heard in the 14.4 - 14.6 MHz band during the day. We monitored this traffic, as well as the joint USN/USCG/DEA anti-smuggling operation, during lunch time from the radio club at work.

There seems to be two categories of 'pirates':

1. clandestine radio stations that transmit for political purposes (e.g. anti-Castro Cuban exiles).

2. broadcasting phreaks that transmit entertainment (e.g. rock music, comedy, etc.)

> Finally, can you recommend a source of information on the current line
> of scanners available, the bands of interest, and the major services on
> those bands? I guess what I am looking for would be an introduction to
> scanners and a buyers guide rolled into one. I've searched local
> bookstores without success, and hesitate to try mail order without a
> recommendation.

Although the newer shortwave receivers sometimes contain scanning circuits, people use the term "scanner" to loosely describe a class of radio that receives the VHF and UHF bands. The first part of this letter deals with stations one can hear on the HF (high frequency) bands, not on a scanner. Since you asked specifically about scanners, I'll assume that you know that HF bands are received by shortwave radios, not the typical scanner. Let me divide the answer into two parts:

1. A good introduction to scanning is Louis Smith's book "The Complete Action Guide to Scanners & Monitors", available for $10.95 from CRB Research1. I think this book is published by TAB, so you may be able to get it through a large book store. I've seen it in electronics stores and in the Bell Labs library. Smith's book is a few years old, so it doesn't discuss the latest model scanners, but gives you an explanation of the features of a typical scanner, and shows several older scanners. It also contains information on what types of stations may be found on which bands.

2. Latest equipment information is available from manufacturers:

   - Radio Shack - annual catalog

   - Regency Electronics

- UNIDEN/Bearcat

Scanner dealers offer good catalogs also:

- Scanner World, USA (best catalog of scanners), 10 New Scotland Avenue, Albany, NY 12208. Tel: 1-518-436-9609.

- Grove Enterprises (good free catalog), 140 Dog Branch Road, PO Box 98, Brasstown, NC 28902.

- Galaxy Electronics ($1 catalog), Box 1202, 67 Eber Avenue, Akron, OH 44309. Tel: 1-216-376-2402.

- Amateur Electronics Supply (catalog), 4828 W. Fond du Lac Avenue, Milwaukee, WI 53216. Tel: 1-800-558-0411

There really is no "Consumer Reports" magazine of scanners, but sporadic equipment reviews are found in Grove's "Monitoring Times" magazine and the RCMA's "Newsletter". "Popular Communications" carries many scanner advertisements but doesn't carry objective product reviews to avoid upsetting their advertisers (but, they don't mind upsetting their readers).

---

1. CRB Research, PO Box 56, Commack, NY 11725.

Some comments on your 6 meter questions:

Range.

Measurements of path loss using FM showed that 6m has 10-20 dB less path loss for distances up to 15 km in hilly, not mountainous, terrain. If either xmtr or rcvr is in a "hole" 6m has 15-30 dB less path loss. This equates to an increased range when using 6m (or a reduced power requirement). Range increase varied, but it was on the order of 5-8 km.

TVI.

TVI was minimized by the vertical polarization and the low (25 w) power output of the mobiles. Even when stationary, no complaints of TVI were received. (Chan 2 was 40 miles away, Chan 3 was 70) Also, no QRM was noted when operating in the parking lot of a Fire/Emerg/Civil Defense Hqs which used frequencies in the VHF-low, VHF-high, and UHF bands. A 2m repeater was also located on their towers.

Rigs.

The Yaesu FT625RD multi-mode rig was used. It is no longer in production, but it was very large for mobile use. Other 6m rigs noted in used eqpt lists: FT620, under $300, FT627RA FM, under $200. ICOM also has 6m rigs.

Frequencies.

52.525 is the National FM Simplex frequency. 52.49 and 52.51 are also designated for FM simplex. (See ARRL Repeater Directory)

From Morton Jim[702,703]@CCC.MFENET on May 21, 1985 at 9:39 PDT
Subject & Phone: packet

  On the serial link, try a cable with just pins 2,3,7 .   this is the minimum cable that will work, just transmit & recieve data and ground. you should be able to short pin 2 to 3 on the tnc end of the cable (without the tnc connected) and what you type on keyboard should echo to the screen. if this does not work, you need some pins connected together on the commodore end of the cable. possibly 4,5,8,20 all tied together. try it again.   once you can reliably type with this "loopback" configuration, you can connect the tnc and it should work. if not, i would venture to say something is wrong with the rs-232 driver in the tnc. perhaps its levels are ok for the epson but not for the commodore.
   i had many problems trying to use a commercial data cable.   i made one with two connectors and 3 conductors of ribbon cable that has worked quite reliably.
good luck.

Before the days of synthesizers people used to swear by commercial
equipment. Everything else was JAP-TRAC. As a matter of fact it
wasn't until the multi-band synthesized radio (UV-3) came out that
most switched around here. I used to have a Micor (which was the
top of the Motorola line), nice solid radio (Western Electric used
to build telephones like this). I also have a 2m PROGLINE. Tubes,
T-Power (WHINE) (Remember "Progress is our most important product").
I never installed it in my new car. It only draws 6 amps on receive,
I'd expect my 4 cylender engine would stop if I transmitted.

-Ron

Note to Vasanthan Sivagnanadasan: Can't send directly to you, as "sivagnan@bgsuvax.UUCP" isn't recognized by the usual ARPA-to-USENET gateway; please give some path info in your signature in future postings, like host1!host2!bgsuvax!sivagnan...

Here is the info on Century Print Shop, a good source for radio-related publications of various kinds, Sams & Tab books at discount, back issues of RIB, FM Atlas, Police Call, etc. Note: this is a one-man operation, run by Don Erickson. I've never had any trouble with my orders from him, but I've heard that others have at times gotten mixed-up orders or delays. [The only delay I've experienced is that he took months to cash my check after shipping the goods! This is in my favor, not in his, so I have no complaint there!] However, he went through a bad period when some heavy rains damaged his stock, and many orders were delayed. I've been advance-ordering the WRTH from him for some years, getting it at a reasonable discount. However, he hasn't arranged yet for next year's advance ordering; he may be stopping that service.

Unfortunately, there isn't much of a discount on the 1985 WRTH if you buy one now. The list is $19.50 and the Century price is $19.00; there's a $1/order shipping charge, so, unless you buy more things than just that one item, it isn't worth it -- you might as well pay full list plus sales tax at a local bookstore. Maybe you have a local discount bookstore where you could get it cheaper?

Anyway, here's the address:

Century Print Shop
Donald E. Erickson
6059 Essex St.
Riverside, CA 92504-1599
(714) 687-5910

Probably be worthwhile writing for his sale flyers -- send an SASE.

Regards,
Will Martin

1. (Re: audio quality) I would think that loudspeaker response would be an
important part of it, but possibly IF filter response would be another.
For transmit audio, the microphone is very important and you can even hear
big differences among ham type transmitters.

For external speakers, by the way, it's HARD TO BEAT the Radio Shack
"CB Extension Speaker" which sells for about $12.95. Add this to even an
HT with low audio power output capability, and you can hear radio calls from
30 feet away from your vehicle (if you put the speaker on the roof or
something), even beside a busy highway. (I am NOT exaggerating!) This speaker
has excellent frequency response shaping for FM voice communications use.

As for microphones, buy a Turner or Shure mobile dynamic mic and you can't
go wrong.

The IF filter is harder to fiddle with. Also, you should be careful, because

the "pros" (meaning Motorola) found out early in the game that you DON'T want a nice square-topped filter -- you want a nice stoop-shouldered Gaussian one because its IMPULSE RESPONSE is also stoop shouldered and short in duration so IGNITION NOISE doesn't ring on into the middle of the 21st century as it would with a sharp-edged filter. Maybe you could buy a 455 KHz IF filter from the "Big M" and substitute it for the one in the el cheapo rig.

I dunno about audio shaping, but maybe you could analyze the offending ham rig with an FM generator and audio voltmeter and plot its frequency response at various points to see where the loss occurs.

2. Six meters. I am not a 6m user, but I have noticed that the ARRL Repeater Guide lists quite a few 6m repeaters. You might want to look at it for hints and maybe get on some of the repeaters and ask for further information.

Good luck!

I've heard that the zerox 820 board for use in packet radio can be obtained for about $50.. Where ?? Can anybody give me an address of a supplier?? I am going to be involved with an evaluation and recommendation session with the National American Red Cross (using packet radio during disasters) and have got to get up-to-speed. I am presently attempting to have our local chapter spring for one (we already have both HF and VHF gear purchased) and need to experiment and demonstrate. Any suggestions ??

Many thanks in advance....

People that manufacture FM gear for commercial uses (at least the BIG
manufacturers like Motorola and G.E.) paid attention to things like
proper pre-emphasis and de-emphasis curves in their transmitters & receivers.
That is why the audio sounds better. Also they tailored the response by
careful selection of the matching speakers. What is desired is not HI-FI
but most effective communications audio.

Several years ago, I reworked my ICOM 22-S because the audio was so "thin"
that I could not recognize who was talking to me. With no modesty whatsoever,
I must say that I paid special attention to the 2 meter repeater that I built
and that its frequency response is flat between 300 and 3000 Hz. Also, the
transmitter deviation is exactly what the received deviation is.
The main problem with the ICOM was that the low end was rolled off. This was
probably done because the amp is low power (less than 1 watt, as I recall)
and if it had full range response, it would have distorted at higher levels
needed in a noisy car.

During my travels around the country, I hear some pretty lousy sounding
repeaters! I think they must have just connected the transmitter input
directly to the rcvr speaker output, without regard for response.
In receivers with transformer outputs, such as a Motorola Motrac/Motran
or older tube types like the Sensicon "A" etc, the output at the speaker
terminals does not follow the standard de-emphasis curve. You have to
get back a stage and add a follower to get the proper response for
repeater use.

Another problem FM'ers face today is the way most "jap-track" rigs

are set up on transmit. Most have way too much mike gain. The deviation may be set properly but usually you can hear a fly fart in the next room! I am told that these rigs are set up this way because the oriental voice/language is not as "harsh" as ours, which requires a more sensitive speech amp setting. At least some of these rigs have a mic gain pot as well as a deviation control. When the gain is too high, there is excessive clipping, which makes it harder to understand the person.

Re: shorted Nicad cells. It is not always necessary to throw them out and start over! Often, zapping them with a burst of high current, followed by normal charging, will bring them back to life for several more years of service.

I do this with a power supply which has internal current limiting to about 1.5 Amps plus a large capacitor across its output. I set it to something above the Nicad cell voltage, like 12 or so volts, and connect it across the dead cell. The capacitor, which is charged to 12 or so volts, zaps much of its charge through the dead cell over a very short time. Judging from the sparks that fly, I would guess that 20 or 30 Amps flows during this burst. I'm not sure what the optimum would be, but 100 uFd at 12 volts seems to bring back most of my dead AA cells. Then the regulated supply goes into current limiting at 1.5 Amps or so and puts some charge into the restored cell. Finally, after 15 or 20 seconds of this, I check the cell with a voltmeter, and it usually reads about 1.3 or 1.4 volts, which, however, is typically dropping off slowly. I then pop the cell into a "normal" charger (50 mA or so for a 450 MAH, "C/10" type cell) and let it soak up a full charge over the recommended 16-hour period. Most of the cells I treat this way come back and work fine for many months thereafter.

Supposedly, one of the cell demise mechanisms is the growth of little conductive whiskers inside the cell which short them out. The zap of high

current burns out these shorts and allows normal cell operation. I speculate that some of the cells I have thrown out after trying my procedure could also be brought back if I had used a larger zapping capacitor, like 5000 uFd or more.

I have found that this procedure works best if applied to INDIVIDUAL 1.2 volt cells. Thus it is still desirable to open up the case to get at the individual cells. However, the procedure sometimes works OK when applied across a whole stack of cells at once, which can be done from the external terminals of a battery pack.

HINTS AND KINKS Department:

If anybody out there in network-landt has had their IC2aT quit working with BP-4 packs and wonders why, it may be the same phenomenon that had me perplexed a couple of years ago:

There is a little spring contact which ties the two halves of the BP-4 pack together. The spring may lose its oomph after awhile and the two halves suddenly lose electrical contact.

This mysterious spring is in the upper left-hand corner if you hold the BP-4 pack with the "business end" facing you and the open side facing down (the side that you start it onto the radio with). By prying the contact up with a sharp instrument, you can restore contact.

Another problem I used to have with BP-4s is that the spring contacts at the ends of the AA cells tended to lose their oomph and leave the cells loose. This especially happens if you drop the pack on a hard surface. I cured this by buying a small sheet of cork material about 1/16 inch thick and cutting out some little pads maybe 1/8 or 3/16 inch square to glue in place inside each spring contact. Now the cork is what ultimately provides the spring tension, and my BP-4 cells NEVER lose their grip on the AA cells.

I understand that ICOM now sells a BP-4A battery pack, which is MUCH better contructed than the old BP-4s which I have. If you have a choice, insist on BP-4A not plain old BP-4 packs, and you may not have the problems I described in the foist place.

Lets make sure the ham bands are used properly. If you find a bootlegger
operating in a ham band (e.g. types running pseudo-CB on 10 meters), please
do all us hams a favor - report it to either the ARRL's Intruder Watch
and/or the FCC!!! We've had to fight for the spectrum we have and its our
responsibility to make sure it is used properly! One reason the FCC is
favoribly disposed toward us hams is that we police ourselves - we don't
need these lids spoiling it for everyone and breaking the law as well (my
breaking the law comment applies both to the illegal operation as well as
the illegal purposes, e.g. drugs, that the operation is for).
Thanx to Bob Purnass for bringing this item to our attentions.

I am selling a Heath SW-7800 receiver... covers 0-30 Mhz...
LSB/USB/AM.... digital frequency display...   New it sells for

around $320... I'll let it go for $200... and for an additional
$30. I will include a Crushcraft 10-80 meter vertical...

My area is just to swamped with am signals.... (I can listen to the closest
station just by picking the phone up while on hook...!) and my favorite
band is 80 which is to close to am for seperation in my area...

201-794-9285 home
212-554-5151 work...

Nick,

You may be able to obtain a manual from Ardco Electronics, P.O. Box 95,
Berwyn, Ill. 60402. I was able to obtain a manual for my SX-110 from them
several years ago.

I have seen a lot of requests for addition to the packet-radio-mailing
list on the info-hams mailing list (net.ham-radio). Let me remind
people that the correct place to send these messages is packet-radio-request
at mit-eddie. People on the UUCP side can join the mailing list. mit-eddie
can be reached through decvax!genrad, ihnp4, and others.

Some people have suggested setting up the sub group net.ham-radio.packet
to gateway the messages on the list to and from usenet. I haven't
decided if this would be a good idea. If we do this, eddie is the
logical place to do it since it is on usenet itself. Please send
replies to this message to me, not the whole list. Thanks,

     ~ Cliff (N1DMM)

Those of us using the shortwave (HF) spectrum over the past few years have seen the solar flux decline and propagation conditions worsen as a result. Some comments in discussions of the sunspot cycle have mentioned fears that this low level is not just the normal trough of an eleven-year cycle, but the beginnings of a longer period of abnormally-low sunspot levels, with concomitant ill effects on our ionosphere.

I know there have historically been periods of low sunspots and these have had effects on earth. What is the current astronomical thinking about this prospect? Is it likely that we are entering into an extended period of low sunspot or solar flux numbers? If so, what is predicted for the extent and severity of this decrease? (Or is it unpredictable?) Or is it just a supposition that this is happening, and the odds are in favor of this being just the trough of a regular 11-year cycle, soon to move back up to levels considered "normal" over the observational history?

This has immediate economic consequences, in addition to the scientific interest. The glaciers might return, which would lower some property values and raise others. (:-) Also, if shortwave propagation is to continue to be as lousy as it has been recently, there is no reason to sink money into fancy and expensive radios, and we might as well wait for the turn of the century and see what technological marvels have been developed, instead of buying some now and watching them become obsolete while we get minimal usage from them...

So, astronomers and solar physicists, what is the answer? What is going to happen on the sun in the next 20 or so years?

Regards,
Will Martin

As you may know, FM band repeaters are licensed by the FCC. The latest
count that I have heard says that there are about 1000 of them in the
books. The only one I actually know of repeats WFRE (Frederick, MD.)
in a shadow area about 5 miles from their mountain-top transmitter.
I suggest you look up Volume III of the FCC rules which cover bradcasting
to learn more.

Re: Sunspots in next 20 years

The Mauder minimum was a period without any sunspots for a period of about 60 years to the point where scientists doubted that they ever existed. During this time the earth experienced the "little ice age". Look at those old book with the people clothed from head to foot in Dickens and others. Remember that picture of Dante with only his face sticking out from a mass of clothes, and that was in "sunny" Italy. The Black Death was not due to plague virus but due to the drop, by an estimated factor of 1/2, in the world's food supply due to the lack of solar activity.

The Worlds temperature has been rising since this period where it reached a peak in 1945, then began to decrease, and by 1960 the growing season was shortened by 2 weeks in England. In the last 10 years the temperature has swung up again, probably mainly due to the extremely high sunspot activity, not the greenhouse effect with CO2 produced by man. Most of the world's CO2 is produced by termites digesting wood and by Ocean plankton, not by man.

We have been seeing the highest solar activity in recorded history, with the peak sunspot count exceeding 200 for the first few times. A decrease is very likely, not to a low but to a more "average" condition. In otherwords we are accustommed to an excessively high sunspot count and are somewhat spoiled by it. Sudden cut offs of solar activity are unlikely, the usual condition being that
the peaks die out over a period of many decades. So in all likelyhood the next peak will be similar to the last but probably may not break 200, although every other peak tends to be somewhat higher and wouldn tend to make this coming one bigger.

I would not let this stop me from buying new equipment. Even during sunspot minimums DX is good even if it is not spectacular, but you have to shift to the
Lower bands. But remember, in 1974, at almost the minimum, there was a solar flare that gave us the same conditions as were in effect during the 1969 peak for 2 weeks. Even without the flare you could work DX and make many contacts by selecting the right band at the right time. The guy that waits for a solar peak for his DX is missing all the challenge.

As far as world wide climatic conditions, the only thing that bothers me is that there is an Ice Age every 25000 years. We have 10,000 years of no ice. The last ice age ended 12000 years ago (10,000BC), and we are 2000 years overdue for another one.

As far as the ice coming gradually, it does not. Mammoths found in

Siberia, frozen in the Ice, had buttercups in their stomachs. What happened so that a mammoth that was eating Buttercups was frozen in ice before the Buttercups digested and remained frozen for over 15000 years? But I would not let this stop me from buying a house.

I hope that answers some of your Questions.

Since the ARPA packet radio list exists, I feel that there is neat info out there that those of us on USENET can't read. Further, a number of articles in net.ham-radio have delt with packet radio topics recently. Therefore, I strongly think a new newsgroup "net.ham-radio.packet" is appropriate and should be cross-fed to the ARPA packet list.

If there are no objections, I will create the new newsgroup.   Are you folks at mit-eddie willing to gateway the info between USENET and the ARPA list?

Speaking of reduced Solar activity, whatever happened to the reports I remember hearing in the eary Seventies that the Sun's thermonuclear reaction had ceased?

Specifically, in the early Seventies, I read about some experiments that dealt with measuring neutrino flux from the Sun. As I recall, neutrino flux had been predicted theoretically and measured in the Fifties or so. Then somebody revised the theory and found that the actual flux should be a factor of two different from what they had thought earlier. So some universities set out to make some new measurements with higher precision, to see if the new theory was borne out by careful measurements. The new setup showed: ZERO neoutrino flux. They assumed that the instrumentation was malfunctioning and checked it all out. It was NOT malfunctioning. It still showed ZERO neutrino flux. According to the theory, if there were a thermonuclear reaction going on in the Sun, this would generate a measureable neutrino flux. In the absence of such a flux, it was concluded that there COULD NOT then be a thermonuclear reaction in the Sun. Since earlier measurements HAD shown the predicted neutrino flux, it was concluded that there HAD BEEN thermonuclear activity in the Sun in the Fifties, but that in the Seventies it had ceased. As I recall, the articles at that time went on to speculate whether it was a permanent change or just a cycle of periodic activity in the Sun.

Does anybody remember these articles? Does anybody know how this disturbing matter was finally interpreted? Assuming that the Sun's thermonuclear power source is now defunct, how long would it take for things to get unpleasantly cool out our way?

NOTE: I believe I can locate a copy of at least one article on this subject from the early Seventies, if anybody cares.

I would consider adapting some used commercial gear in massively greater
preference to either brand mentioned. You can buy used GE, or Motorola
repeaters for $800 and up through places like Gregory Electronics (in
Pennsylvania, I think) or California Radio in Montrose, Colorado, or
another outfit in El Paso, Texas, etc....
While I have not used either brand mentioned, one look at the construction
should be revealing, and our Colorado frequency coordinator gags every time
someone mentions the brand names listed. He has left me with the impression
that all the major interference problems in the state can be traced to those
brands, either transmitter of receiver deficiencies being the primary cause.
I have no first-hand experience with these machines, but I have worked on
GE, Motorola, RCA and Johnson RF gear, and don't believe I'd put anything
less on a mountain.

Strictly opinions of the writer, not reflecting any position, statement,
opinion, belief or knowledge of any other person or organization which
presently or may in the future, exist.

73, Chris kelly...WD5IBS

Re: DXing during periods of low Solar flux. Gee, guys, all we have to do is have even a SMALL nuclear war once in a while and the ionization will go back up and give us some real nice band openings at VHF followed by several good days of DXing on 10, 15 and 20. (Not to mention the WARC bands.)
Ya just gotta think positive, is all.

Regarding my own question, I recently had the chance to put it to an astronaut (Ron Parise, WA4SIR). He said he had wondered the same thing, and didn't really know the reason for certain. We came to a consensus on a couple of possibilities, which I paraphrase here:

1. Pickup from noise sources on board (Owen Garriott might have just found a quiet spot when he operated 2mFM). The orbiter is filled with blowers, fans, and is quite noisy. These might have been amplified by compressors in the regular speech processors (see #4).

2. The air-to-ground links are digital only to the TDRS ground station. From there they are relayed in analog form over a concatenation of satellite and landline links which can each add their share of noise.

3. Noise in the wireless headset links used on board.

4. Large amounts of compression and/or clipping in the speech processors, combined with incorrect gain settings and astronauts talking away from their microphones.

Regarding the sub-topic of monitoring the HF bands from orbit, I suspect that conditions on the lower frequencies would be rather poor. We hams have already had experiences with sending signals through the ionosphere with the Oscar and RS Mode A downlinks on 10m, and the HF beacons experiment on UoSAT-Oscar-9. In each case, if the band in question is "open", you'll have a hard time penetrating the ionosphere for earth/satellite communications. Even when a low frequency band, e.g., 80m, is closed, it's because of high ionospheric absorption so again you're going to have a rough time.

For example, whenever 10 meters is open, Mode A reception when the satellite is just above the horizon is very poor and in fact you're just as likely to hear the satellite when it's below the horizon.

DXing the VHF/UHF bands and above is likely to be more productive, since you can see everything in line of sight and the ionosphere rarely interferes. I remember a story a while ago (I forget where) which listed a few UHF TV stations which were receivable on the moon. The criteria wasn't signal strength, it was lack of other interfering assignments to the same channel. I remembered this story because one of the stations cited was WMPB-TV on channel 67 in Owings Mills, MD, where I used to spend college summers working as a broadcast technician.

One of the less-known capabilities of the old WE 600 series telephone instruments is that automatic compensation is provided for losses in the local loop; a varisistor driven by the DC level as seen at the instrument is used to adjust the signal level. This is not an audio compression circuit; it's the long-term DC voltage (``battery'' in telco terminology) as seen at the instrument that does it.

Since a varisistor is a non-linear component, this makes a telephone an RF detector in theory and sometimes in fact, and there was a fix kit for RFI available for the model 600 at one time; later models had it built-in.

This gives a little more insight into what's inside that potted network.

Try
The American Radio Relay League
225 Main St
Newington, Ct. 06111.

They have a book out, called "Tune in the World with Amateur Radio",
which I would highly recommend in preparation for your novice exam.

They also would know where some exams are in your area.
You would want to get in touch with the Volunteer Exam Coordinator
office, same address, for exam dates and times.

                  Peter Baldwin, WA1SNH

There was a contsruction article in the old Popular Electronics about the spring
of 1976 for a NiCad Zapper. Basically, they used a charger of about 50 ma but
about 25 vdc to charge up a 3300 or so ufd cap and "zap" a shorted nicad cell.

After the zap, the cell would continue getting charged at the 50 ma rate.

NiCads ususally short from reverse voltage. "But honest, I didn't put the batteries in backwards!" You don't have to. Running NiCads to a partial discharge does more than lead to the potential for a "memory charge". Lets say that you have a new pack of multiple cells fuly charged. You run it down to about 30%. Since any two batteries are not EXACTLY equal, maybe one is at 28% and another is at 32%. If you don't fully charge the cells up to 100%, ie you let the 28% cell only charge to 95% while the rest are charged to 100%, the 95% cell will be the first to go dead. With one cell dead and the others still pumping power, the curent will effectively be trying to charge the dead cell "backwards". NiCads will actually take a small reverse charge, but the internal construction of the cell leads to small deposits when this happens and these are what "shorts" the cell.

How can you avoid this? Well, the easiest way is to always make sure that you give your pack a FULL rcharge. The standard .1C (usually 45ma) rate can be kept up almost indefinately with out cell damage. Running the full 14 hours certainly won't hurt the cell.

As for a simple "zapper" I used a 24 vac transformer, full wave bridge, current limiting resistor for about 50 ma on my 8 unit pack, and 3300 ufd cap. Don't try to use a switch on the cap to connect the cell, the pulse is SEVERAL amps. I just slip the cell into the holder. I used to get all my NiCads for free, or almost free, by hitting the local Radio Shack and Lafayette stores. They would give me the units that customers returned as "bad".

Also, you can do more than one cell at a time, but cells in series will limit the current pulse through the bad cell. If zapping a pak doesn't fix it, break the pak down and zap the bad cell by itself.

Forgive me for misdirecting this if I have -- I recall seeing a recent query from someone who wanted to be able to broadcast over the FM band so that he could receive his choice of music over an FM Walkman-type radio while working on his farm. This is directed toward a possible solution or a device applicable to that need.

This could also be applied to the net.audio submitter who wanted to feed his TV audio through his stereo system.

I just received an ad from DECO Industries, Box 607, Bedford Hills, NY 10507 (914) 241-2827, for a device they call a "Video Simulcaster". This is designed to pick up the TV audio from the earphone jack and retransmit it over the FM band. It is an "easily assembled" (hmmm...:-) kit which sells for $29.95 (free shipping if prepaid). Claimed range is 300 feet -- for longer range operations, like the desired farm use, you could either simply illegally amplify the output, or maybe feed it into a loop wire antenna which goes into the fields (probably also illegal, due to that antenna's length).

I assume you could feed anything into this at audio line level, so it isn't limited to rebroadcasting TV audio, of course.

(COD's cost $4.00 more.)

Usual disclaimer -- I never heard of these people before; just thought it was interesting that I got their ad just after seeing a couple net inquiries that it would apply to...

Regards,
Will Martin

Regarding our recent discussion about the World Radio TV Handbook (WRTH) and the prices thereof:

I just got a new catalog from ye olde Publishers Central Bureau, only the fifth or seventh this year so far (:-), but this is a "special sale" catalog (where have I heard that before...), with some of their books marked down to a lower price. (What hurts is that I bought some at the higher price! The knife of self-recrimination twists slowly in the gut...)

Anyway, one of the items on sale is newly-listed (I've never seen one of these listed in a PCB catalog before); the 1984 WRTH! For $6.00, which is probably about what it's worth, but is much lower than other sources of back issues (like Century Print Shop). The stock number is 446235. If you don't have a WRTH, getting last year's for this price is probably worthwhile. As I mentioned in an earlier posting, the 1985 frequency listings are already nearly obsolete, so the unchanging or more-stable data (like station addresses, interval signals, etc.) is probably good enough in the preceeding year's issue to be useful.

Another radio-related book, marked down on special sale, is a real bargain. It is the 1979-80 issue of JANE'S MILITARY COMMUNICATIONS, one of the authoritative Jane's series of guides to military equipment. It is marked down to $7.98 (original list $99.50) [I had bought my copy at around $15, sob!]. The stock number is 391562. This is a good guide to then-current military electronics gear, which might show up on the surplus market, or fall into your hands whilst strolling through Central America, and could be helpful in identifying this or that odd piece of surplus stuff you happen to get ahold of.

A few notes about ordering these, if you are interested:

1) You must mention "special sale department #345".

2) Offer is good through Labor Day, '85.

3) There is a per-order shipping charge of $2.60, no matter how much you buy -- I recommend you ask co-workers for recent catalogs or check you local or work libraries, so you can see if there is other stuff you want to add to ordering just one or two books.

4) These people always stick you with a "credit voucher" if you pay by check and stuff is out-of-stock, and back-orders take forever, if they ever show up. I tried asking for a refund check instead of a credit voucher with my just-sent-in order; we'll see if they pay attention...

Here is their address: Publishers Central Bureau

One Champion Ave., Dept 345
Avenel, NJ 07131

(Any of you New Jersey netters happen to know if they have a retail outlet
where you can just go and buy this stuff at the catalog sale prices?)

Usual disclaimer -- I've been buying from these people for years, but really
don't like them much. I certainly have no interest or connection with them.

Will Martin

If he gags on those two, what DOES he recommend? (I have absolutely
no familiarity with repeater equipment, but I am curious).

I suggest that you call it simply "net.packet" as net.ham-radio.packet is
much longer than 14 characters which is the maxmimum length for a name
using notes (or news services that depend on a directory name).

to all radio amateurs bt

fcc has issued a notice of proposed rulemaking in general docket 85 113 which would amend part 2 to make land mobile a primary service on the frequencies 421 to 430 mhz in the cities of detroit, cleveland, and buffalo. amateurs are already secondary in this band, and those within 75 miles of canada are on notice that coordination will be required. moreover, adoption of the rules proposed in the docket does not mandate immediate change. there must be separate rulemaking actions in parts 22 and 90 before land mobile can start applying for frequencies. anyone interested in filing comments on this docket are strongly urged to send an s.a.s.e. to arrl hq. for a copy of the notice, and to read it carefully before filing. comments may be filed until may 28.

Subject: ICOM 22S mods
Message-ID: <16846@mgweed.UUCP>
Date: Wed, 1-May-85 21:25:44 EDT
Article-I.D.: mgweed.16846
Posted: Wed May 1 21:25:44 1985
Date-Received: Fri, 3-May-85 02:49:45 EDT
Organization: AT&T Consumer Products - Montgomery Illinois
Lines: 143

Someone asked about mods for the Icom 22S. I have been well pleased
with mine, except for one minor problem, which I will mention later.

I don't know where this document came from that I will quote from
and I assume that the mods in mine were made from this dope.
(I got mine 2nd hand and it already worked below 146).

"to operate below 146 mhz:

1. locate IC1 on synthesizer board. remove diodes connected to
pins 7 and 8 going to pin 13, and the 10k resistor from pin
13 going to ground.

2. Connect pin 13 to pin 16 of IC-1.

3. locate IC-10 on the PLL board. Cut pin 2 close to the
board and bend upwards. Cut the path between pins 2 and 5.
Connect a 10k resistor from pin 5 to ground. Connect cathode
of a silicon switching diode to pin 2. Connect its anode to
pin 5 of IC-8. Connect a jumper between IC-10 pin 2 and 5.

4. Connect another diode on IC-10: cathode to pin 5, anode
to pin 6.

These mods still have the radio operating on 15 kHz channels.
The ./. N factor for the channel you want is figured
as F-144.39 / .015

For example, 144.990 is divide by 40, and 145.005 is divide
by 41.

I found that the RF stages in both the rcvr and xmtr needed repeaking to use below 146 MHz. There is no way the 22S will cover 144 to 148, RF-wise. You can get 3 out of the 4 MHz and that is about it.

My 22S block diagram shows that a reference frequency of 7.5 kHz is used, derived from a 7.68 MHz osc. I would assume that to get a 20 kHz spacing between channels, one would need to use a crystal that would derive a 10 kHz reference - I have not explored this.

The problem I mentioned was intermittent locking of the PLL. The problem was caused by corroded connections in the plug on the matrix board. Cleaning did no good, so I removed the pins and the board connector and "hard wired" the matrix board using ribbon cable.

/-/-/-/-/-/-/-/ additional changes /-/-/-/-/-/-/-/-/-/-/-/

I tripled the number of channels the 22S will operate on by adding one switch on the rear of the unit. This switch is now wired as the power switch. The original front panel power switch is now labeled C, E (center), and D. The original duplex switch is left alone - A, S (simplex) and B.

All diodes were removed from the matrix board and new ones were installed as shown below, except to rows 0, 6, and 7.

The C-E-D switch is now wired as follows:

1. ground the common contact.

2. connect the C contact of the switch to the D7 wire of the matrix board.

3. connect the D contact to the D6 wire of the matrix board.

4. Connect two 2.7k resistors from +9 volts to the C and D lines.

5. Install diodes in positions D1 thru D5 as follows:

CHAN	D5	D4	D3	D2	D1	FREQ	CHAN	D5	D4	D3	D2	D1	FREQ
1	x		x	x		146.01	11					x	146.34
2	x		x	x	x	146.04	12				x		146.37
3	x	x				146.07	13				x	x	146.40
4	x	x			x	146.10	14			x			146.43
5	x	x		x		146.13	15			x		x	146.46
6	x	x		x	x	146.16	16			x	x		146.49
7	x	x	x			146.19	17			x	x	x	146.52
8	x	x	x		x	146.22	18		x				146.55
9	x	x	x	x		146.25	19		x			x	146.58

10 x x x x x 146.28

NOTE: I have put no diodes in row D0. This row is only needed for frequencies ending in "5".

Position 24 on the selector is blank and is used to obtain 146.31, which requires no diodes.

With the modifications as outlined, the following channels are available:

SIMPLEX CHANNELS

CHAN	FREQ	CHAN	FREQ	CHAN	FREQ
		14D	146.43		
15C	145.50	15D	146.46	15E	147.42

HOW DO YOU FIND THESE FREQUENCIES?
PART I - BOOKS, MICROFICHE, RADIO CLUBS

Bob Parnass, AJ9S

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the _P_o_l_i_c_e__C_a_l_l__R_a_d_i_o__G_u_i_d_e_, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for about $7. _P_o_l_i_c_e__C_a_l_l is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Prelinger's new book, _M_o_n_i_t_o_r__A_m_e_r_i_c_a_, published by SMB Publishing, and available from Grove Enterprises for about $15. This single edition contains 582 pages of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). _M_o_n_i_t_o_r__A_m_e_r_i_c_a con-tains detailed communications system profiles and pre-cinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from _P_o_l_i_c_e__C_a_l_l_, which gives a more sterile, but uni-form treatment of licensees, listing even the smallest of towns.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page

_T_o_p__S_e_c_r_e_t__R_e_g_i_s_t_r_y__o_f__U_S__G_o_v_e_r_n_m_e_n_t__R_a_d_i_o__F_r_e_q_u_e_n_c_i_e_s_.

Published by CRB Research, the 5th edition is available from Galaxy Electronics (Box 1202, 67 Eber Ave., Akron, Ohio) for about $15. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, mis-sile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never pub-lished sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this diffi-cult to obtain information.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's _M_o_n_i_t_o_r_i_n_g__T_i_m_e_s and Kneitel's sensationalistic _P_o_p_u_l_a_r__C_o_m_m_u_n_i_c_a_t_i_o_n_s_.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, to the public through the US Bureau of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Amored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Copies of some of the FCC microfiche files are sold by Grove Enterprises. Buying from Grove is usually cheaper than buying directly from NTIS, although Grove doesn't offer all the files available from the government.

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche are available from Grove Enterprises for $25. In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government recently released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sells this set of 33 microfiche cards for about $13.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

In 20 years of being an amateur radio operator, and belonging to amateur radio clubs, I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $16.50 per year, which includes a monthly newsletter of about 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

The Scanner Association of North American (SCAN) is a scanner organization headquartered in Chicago. Having no elected officers or meetings, SCAN is not a club in the traditional sense, rather it is run by an advertising agency contracted by the manufacturer of Bearcat scanners. The $12 per year membership fee includes _S_C_A_N__M_a_g_a_z_i_n_e_, a thin, albeit glossy, bimonthly.

Membership information is available from:

Scanner Association of North America
240 Fencl Lane
Hillside, Illinois 60162

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of informa-

tion. Other times, the frequency information is there for the taking - without hassle. More about this in the next installment.

The TAPR group was well represented at Dayton this year. For
those who didnt get a chance to see the new board it is Z80
based and is in a much smaller package similiar to a Hays
Smart Modem in size. The cost will be under $200 and it really
looks good. I forgot to bring in the feature sheet I got but
when I do , I will post more info.   de KN9K   RICH

Tony,

I do not originate the propagation forecasts, I just receive them

from W1AW, the ARRL station, and relay them here on the net.
I have not really studied propagation myself but do find it
interesting.

<...>

Space shuttle mission audio is being rebroadcast by WA3NAN, the Goddard
Amateur Radio Club, on the following frequencies:

      3860 Khz (Received here in Central Mass)
      7185 Khz ("   "   ")
     14295 Khz (not received here, but announced on WA3NAN)

     (all Upper Sideband)

They appear to miss some of it...e.g. during LOS, mission control
announced that they were going to play an interview with someone. Then
dead air for 5 min, then they announced that the interview was over.

In any case, if you can receive it, it is a lot cheaper than $.30 /minute
on the 900 number!

I am looking for the Eastnet packet station map.
(For those unfamiliar with this, it is a list of packet stations
that can be used as repeaters covering the East coast from New England to
Florida.)
It has been circulating via packet radio but I can't find a copy ...
I have seen a few packets of it floating around when monitoring 145.01
but can't catch the whole thing.

Thanks.
73, jim KY2D

<...>

I should also mention that

1) WA3NAN indicated that they were also transmitting on
~14n Mhz FM. I presume this is a repeater frequency which
would not have a very great range, so I did not copy the
frequency down.

2) If I did not say so before, the transmissions originate in
Greenbelt Maryland, USA. Don't know how well they can be
heard at other places in the world. I'm new to this DX stuff.

3) During Spacelab 1, I was at Edwards AFB for the landing, and
found that the JPL Amateur club was transmitting the same
stuff on repeater frequencies. Those of you on the
near the Pacific may find that the same folks are also transmitting
on other AM frequencies just as Goddard is. Worth a try if you
can't get Goddard.

TAPR Announces TNC 2
or

The Rumors You Heard About Dayton Were True!

Tucson Amateur Packet Radio (TAPR) proudly announces a low-cost, no-compromise Terminal Node Controller (TNC), the TAPR TNC 2.

TNC 2 is a complete packet radio controller, incorporating the experience gained in supplying nearly 2500 TNCs to the world's Radio Amateurs.

TNC 2 utilizes the proven TAPR modem design with a switched capacitor input filter and plug-in headers to configure the on-board modem for various modes of operation, including 1200 baud, 1000 Hz shift and 300 baud, 200 Hz shift.

TNC 2 is based on a CMOS version of the popular Z80 microprocessor, and utilizes the Z80 SIO with a state machine to implement the HDLC NRZI packet format required by the AX.25 Level Two standard. The 8 k bytes of RAM are backed with a Lithium battery to retain all stored commands and operating parameters.

TNC 2 's software provides enhanced monitor mode, full support of the AX.25 Level two protocol, including Version 2.0, and other evolutionary features.

TNC 2 operates from a 12 volt dc (nominal) power source and is significantly smaller than the previous TAPR TNC (now called TNC 1).

TNC 2 is curently in field testing and is expected to be released during the summer. At a price of only $185 for the complete kit, including cabinet, high performance packet radio operation is now affordable by most Amateurs.

PLEASE NOTE: TAPR is not accepting orders for TNC 2 at this time.
No waiting list is being maintained.

    It seems that for some reason (beginning yesterday evening I
    think) mail from usenet bound for info-hams has been sent twice,
    with about a half hour between sendings. Can something be done
    to correct this? Thanks. /Lee Richardson, W6RFK

This appears to be a problem at BRL. It is happening with Info-Micro
and Info-Cpm as well as several other groups that receive usenet
forwarding.

------- End of Forwarded Message

I happened to be in Clear Lake City (Houston Suburb where NASA - Johnson Space Flight Center is located) during the October, 1984 Shuttle mission. They were playing Shuttle audio over the NASA club repeater. I especially got a kick out of it because I had innocently turned on my HT on the way down from my hotel room to breakfast, just to monitor for ham activity. I thought nothing much of it when I heard a woman's voice discussing some technical things I didn't quite get the context of until a man's voice came on saying, "Sally, this is Houston. Could you move the arm so that..." -- and then it hit me

what I was listening to! It must be fun to have access to that facility on a daily basis during Shuttle missions. You hear a lot of news in the making, and only a tiny fraction of the actual audio gets onto the TV newscasts.

The following is an incomplete list of Hamfests scheduled in the Baltimore, Washington, Pennsylvania areas:

16 June Federick Hamfest/Frederick MD 301 845 6949
Frederick Fairgrounds, East Patrick St.

7 July Wilkes-Barre, PA (Murgas ARC) 717 388 6863
109th FA Armory, Market St. Kingtson, PA

28 July Maryland Hamfest (BRATS)
Howard County Fairgrounds

26 Aug Hersheypark Hamfest/Computerfest 717 697 1880
Hersheypark, PA

Anyone having more is encouraged to add to the list.
In particular, does anyone known when Manassas is?

HOW DO YOU FIND THESE FREQUENCIES?
PART II - SLEUTHING

Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall1, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly con-

scientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, about half the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to know who he's listening to. Some stations may operate for years using the undescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

The following examples illustrate techniques I've used to derive new frequency information.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open

house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard proudly displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

  In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he gladly demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door had activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Two older models, the Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and

parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs - this would have made life a lot easier for me, and legal for them!2 Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer atten-

tion to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center3
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Since two-way radio users sometimes fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

---

1. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

2. One may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.

3. XYZ is a pseudonym for the actual licensee name.

Hello,

I would like to get into some satellite work from my apt. here in Manhattan, and I would like to know if anyone else has attempted such a feat from an urban area. If so, what type of antenna/rig/etc did you use (the roof is, {*Sigh*} out of the question)? Could you point me toward some good books on projects, etc? I am also interested in playing with some satv, any pointers here?

Thanks Much & 73,

Well, I cannot answer for your feelings of being burned, but there is something which everyone must remember about TAPR: they are NOT in business! TAPR is a nonprofit R&D corporation, and they all have other jobs, with the phone secretary being the only paid employee. Their interest in making the TNC's is strictly to promote packet radio, ham radio, and in this they have been diligent and successful. Ham radio will grow because TAPR has done what the commercial radio manufacturers will not or cannot do: produce first class products for a decent price, forming a bridge between the radio and the computer which most hobbyists can afford. When they sold the rights to Heathkit and AEA on the TNC 1 design, it was for a strictly nominal ammount.

Now, as the progress in packet makes a less expensive form of TNC available, more people yet can afford the mode, and TAPR had lots of money tied up in the remaining kits. As a naive buyer, would you prefer to send your dollars to an unknown outfit in Tucson or to Heathkit? Well, its my guess that after Heathkit came out with a $299 kit with cabinet, few TAPR TNCs sold at the old price, and TAPR had to clear out its inventory. All the "bearded experimenters" who were able to take the plunge already had their TNC's (I own 3) and the more cautious users preferred the bigger name of Heath.

TAPR will be spending more time yet developing 9600 baud modem boards, and possibly even 220 MHz RF decks for high speed packet, boosting both the computer-ham radio link and the use of the 220 band. I have lots of respect for those guys, both technically and personally, for continuing their efforts in an environment which would probably dishearten and tire me, especially after I already spent 8 hours at my regular job, and 4 years developing first class equipment for marginally grateful ham community.

Reply-To: Ozaki.FX

Do you think that ICOM, YAESU, KENWOOD and others are making separate
CPUs for each band of rigs? No! They use same CPU for series of
rigs(e.g. IC-02, IC-03, IC-04s). Nonetheless, they even use the exactly
same CPU for JA's, Europes, USAs and other contries(you know, their
band plans are bit different from one another). So, you can simply
change your rig to cover freq ranges as wide as the CPU has been
programed. What makes all the differences are the DIODES and some
registors. It's just combination of those diodes and registors to tell
CPU which mode(freq range) to operate. For example, my IC-03N (which
might be IC-04A in the States) would display 50MHz, 144MHz, 220MHz,
440MHz, and even 1200MHz, too. Of course, it does not receive nor
transmits on other bands, because PLL circuit is made for 440MHz band
only. Our band plan for 440MHz band is between 430.00MHz thru
439.99MHz, but I could easily enlarge its coverage from 420MHz to
450MHz, by cutting one lead of a diode. If you have thumb wheel type
rig, it's much easier to widen its coverage. Try to find the chip named
9122 near the PLL circuitry, that's a programmable devider which control
PLL to determine the output frequency. Maybe, you'd have to study a bit

about PLL circuits, but once you know the principle of its operation, it would be nothing to change it to whatever the ways you want to. Have fun with your PLLs.

qst de k9eui
hr summary of bulletins 29 and 31 and dec. 1984 qst
to all radio amateurs bt

effective june 17 amateurs can operate rtty, fax and sstv on 160 meters per report & order in docket 84-959.

effective 0001 utc june 22 the 30 meter band becomes official (10,100 to 10,150 khz).

also effective 0001 utc june 22, we get the 12 meter band. while the 30 meter band will remain restricted to a1 and f1 emissions with 200 watts pep, the 12 meter band will not have power restrictions. 12 meter band emissions will be as follows:

24,890 to 24,930   a1 and f1
24,930 to 24,990   a1, a3, a4, a5, f3, f4, and f5

at this time, there is no plan to release 18,068 to 18,168 khz to u.s. amateurs before 1989   ar

qst de k9eui
hr propagation forecast bulletin nr 21 from arrl headquarters
newington ct may 5, 1985
to all radio amateurs bt

there is little to be said for the period april 20 to may 2 except that, if your interest in amateur radio survived those two weeks, you need not worry about anything much worse to come. the generally low muf and the preponderance of weak signals and severe fading also showed that higher solar flux and sunspot numbers do not necessarily make for improved long distance communication. during late april solar activity came in sudden surges, mostly of short duration, resulting in very

high surges in the earths magnetic field. this is about the worst thing that could happen for hf propagation in the higher (garble). the severity of these disturbances was such that almost total blackouts of wwv reception were observed in the writers florida location for the first time in several years of part time southern living.

somewhat improved propagation can be expected this week, but not because of higher solar flux or sunspot numbers. on may 3, 4 and 5 the solar flux curve is superimposed on the curve for april at 71, 70 and 70. as in early april we should be moving into periods of more stability and better hf propagation, especially may 10 through 16. this will affect 14 mhz and lower frequencies mainly.

on may 5 we had our first good sporadic e skip on 28 mhz, and there were a few contacts on 50 mhz as well. more of this will be showing up later this month, but the real peak usually comes late in june. most likely hours are mid morning and early evening, but e skip can come at any time. multiple hop propagation may extend the skip range to transcontinental or even transatlantic distances, though a few hundred miles is much more (common). sporadic e skip openings are not directly related to sunspot numbers or the solar flux level.

american sunspot numbers for april 25 to may 1 were between 35 and 19 with a mean of 27.1 ar

Listening to Cellular Telephones Using a Television Set

Several weeks ago, I posted an article in which I told of being able to hear 800 MHz land mobile communications on my 800 MHz television set.

Here are some excerpts from a letter to the editor appearing in the May 1985 issue of Personal Communications magazine:

> "In reference to your March 1985 article on cellular privacy, I have developed a technique for eavesdropping on cellular users that requires no fancy scanner, no computer, no sophisticated antennas or any other gimcracks....."
>
> "....By using the manual tuning on the varactor tuner in my VCR I have little difficulty listening to the neighborhood cell sites on my 1973 model Zenith TV.... Since sidetone is transmitted I hear both ends of the conversation....."
>
> "Handoff is an irritation, but frequently I am able to manually sweep across the band and pick up where they left me. What really irks me is the low audio level from the TV due to the deviation mismatch."
>
> "The real significance of all this is that anyone with a TV and VCR connected to a TV antenna can get the same results with a little practice...."

Trick the Bearcat BC220 to Search 136 - 144 MHz

Here's a trick for altering the frequency limits of the early version of the BC220, which appears in Grove's "The Best of 1982 Monitoring Times".

I don't have a BC220 to try this trick - does it work?

To search 136 - 144 MHz:

1. turn the set off and on to clear the memory
2. manually select any channel
3. enter 136.0 MHz
4. enter 144.0 and press LIMIT
5. press SEARCH (reads ERROR)
6. press LIMIT (reads 136.0 MHz)
7. press SEARCH

You may restrict this out of band search sequence further once steps 1 through 7 have been executed. While the receiver is searching, open the squelch at whatever frequency you would like to select as the upper search limit; then:

a. press 136.0 LIMIT
b. press SEARCH (reads ERROR)
c. press LIMIT (reads the frequency at which you stopped searching)
d. press SEARCH and close squelch again to resume searching

A number of frequency ranges may be substituted for the example above, but only in the early versions of the BC220 with the older microprocessors.

Two elementary questions from a novice:

1. What is a good reference book giving characteristics of various types
of transisters?

2. Is there an outfit (there must be) from which you can mail order componants
(I particularly need some small coupling transformers, Radio shack doesn't
seem to have them in their catalog)?
   is there a way to measure the inductance of a home-made transformer?

Thanks.

In the May issue of "73" magazine I saw an ad for a microphone/earphone combination for use with HTs. It used a press to talk switch and the cost was about $100. It claimed a space age technology but looks very much like an earphone that doubles as a microphone to amplify the sound available in your ear canal when you speak. I don't know how this works, but folks here in the office speculate that this might be something like the earphones used by the secret service. (Never saw one of those guys with a boom mike)

This device was available for the ICOM-02AT and was advertised as a good solution for noisy environments.

I don't want to think about what could happen to your ear if you crash while using this thing. (The proof is left as an exercise for the student......

The following discussion has recently arisen on the Videotech list;
I thought Info-Hams (& net.ham-radio) people might be interested in it:

Date: Mon, 06 May 85 09:34:28 CDT
From: mooremj@Eglin-Vax
Subject: What is the maximum range of VHF reception?
To: videotech@Sri-Csl

Questions about (gasp! how primitive) broadcast TV.

I live in an area where, due to local politics, we do not have cable TV
and probably won't for a few years. Realizing this, I bought a 30-foot
mast, the biggest antenna I could find, a rotator and a pre-amplifier;
I also live on top of a hill, so my configuration is pretty close to
optimum. After experimenting I find that my maximum range for a good
VHF picture is about 200 miles (New Orleans) on cloudy days, 150 miles
on clear days. Occasionally I get a picture from a Birmingham station
(230 miles), but it's not reliable. Now I thought that was pretty good;
but several of the old-timers in this area swear that one can sometimes
receive stations in the Yucatan, which is over 400 miles away across the
Gulf. Question #1: Is this possible? I know some Mexican stations are
much more powerful than American stations.

Question #2: My antenna has what is called an "FM filter", but I still
get blasted away by a station at 88.1 MHz when I try to watch Channel 6.
(The FM station is 50 miles away, channel 6 is 180 miles away, in opposite
directions.) Is there any way I can further reduce the FM signal without
affecting Channel 6?

Question #3: Is my 200-mile limit the best that can be done? What IS the
extreme range of VHF reception?

Thanks in advance,
Marty Moore (MOOREMJ@EGLIN-VAX.ARPA)

Subject: Re: What is the maximum range of VHF reception?

TV DXing (which is what you are really talking about) is a hobby in its
own right. I have never indulged, myself, but a friend, Glenn Hauser, is
one of the nation's top TV DXers (he once had an article on the subject
published in TV Guide, and also has had articles in various radio-related
publications, like the World Radio-TV Handbook).

There are several methods for long-distance propagation of high-frequency (VHF and up) signals, such as "tropospheric ducting", "Sporadic E", and "meteor scatter". (I don't know much more about these than the names, though I know the last one involves catching the short-term reflections of signals off the ionized trails of meteors -- that one always struck me as fairly exotic...)

There is a club devoted to this hobby -- if I recall correctly, the name is the Worldwide TV/FM DX Club, and their bulletin is The VHF/UHF Digest. I don't have their address here at work; if you or others are interested, I can look it up and post it. (You can find it in a back issue of Popular Communications, if a local library gets that magazine...)

Anyway, Glenn and many other TV DXers have had quite long-range catches. One I recall offhand, when he was in the USAF in Thailand, was when he picked up Saudi Arabia. Of course, equatorial conditions are different from those here in the temperate zone, but that can give you an idea.

I wouldn't be surprised if there was NO "theoretical" limit on the distance you could pick up a signal -- it would all depend on the propagation conditions, local electrical noise and interference, transmitter power, and antenna configuration at both ends... So the maximum would be 12,500 miles or so, on the opposite side of the globe. And there are ways to receive signals via the "long path", which means going the "wrong" way around the earth, which could increase that [and, if you figure multi-circumferential paths, you can go up indefinitely!]. (This, of course, only refers to terrestrial transmission & reception; we've seen TV pictures from Saturn, after all...)

Subject: Re: What is the maximum range of VHF reception?

I looked up the data on the TV (and FM & public-service stuff, too) DXing club. Here it is:

Worldwide TV/FM DX Association
PO Box 514
Buffalo, NY 14205

Their monthly bulletin is The VHF/UHF Digest. Sample copies were $1.25 as of the 1983 copy I happen to have (though the address was verified as still being OK in the 1985 World Radio TV Handbook).

They also put out a pamphlet as an introduction to the hobby; if you are at all interested in this (and the equipment investment mentioned indicates a definite interest!), it would be worth sending them $2.00 (again, the price as of 1983, but probably still good) for a copy of

"Beyond Shortwave". This should answer any questions about modes of propagation, expected distances of reception under typical conditions, and general info on receivers and antennas.

The monthly bulletins consist mainly of reception reports and news about new and changed stations, call letters, powers, etc. There are sometimes equipment reviews; the issues I bought back in 1983 had some info on the then-new Carver tuner. Equipment reviews in this sort of publication can be quite useful; since they are informal, written by people who own the gear, and often are printed after the equipment has been around a while, they contain data on aspects like reliability, which is seldom mentioned in just-released-product reviews in the "slick" magazines. For example, years ago I bought a Pioneer TX-9100 tuner based on a review which discussed using it for mobile FM DXing while travelling cross-country by car (with an inverter power supply). It got much abuse but still worked well. Based on that info, I picked one up when they were being closed-out at discount from a local hi-fi emporium and was well pleased with it thereafter. Now, seeing some references in the audio press to this tuner, I find I have a "classic"! So I place some faith in this sort of equipment review, whether it is positive or negative. Since there is no advertising (or payment!), there can be no pressure on the reviewer.

Hope this info is of interest...

Regards,

I've really been interested in that space shuttle rebroadcasting stuff. My sister was one of the hundreds of teachers from New York State who filled out those teacher in space program applications. Boy, what a mess... They give you tiny sheets that you have to type on. I eventually wound up scribing the whole mess to make it fit just

perfectly. I wonder if there's anyway to find out what the story is
on all that stuff.

Re: TV DXing

In reference to how far you can get on TV, here on the Great Lakes we regularly receive stations 200 miles away with a radio shack $25 antenna and an old rotar. The antenna is about 20 feet off the ground. During Summer, particularly, we get excellent reception, but almost never during the Winter. The duct formed is due to the humidity and temperature differentials. We can regularly pick up stations in Ottawa,Toronto, and Quebec. My son sent in a DX report and asked for QSL cards and he got a long distance phone call from the station manager in Quebec because he thought it was impossible and wanted to know how we did it.

During World War II there was a guy in Boston that that picked up Rommels Afrika Corps regularly on about 150 MHz. The data was relayed to Washington and decoded, one of the factors leading to Rommels failure. (The "key to Rebecca" story about the same thing was pure fiction).

Also, one night, my wife picked up a New Orleans FM station (about a 1000 miles away) on her radio in the kitchen with an internal antenna. We all verified that the station was one in New Orleans.

Joe N2XS

------- Forwarded Message

Date: 9 May 1985 0731-EST (Thursday)
From: bccvax!rachiele@nadc
Received: from nadc by SIMTEL20.ARPA with TCP; Wed 8 May 85 13:43:49-MDT

To: info-hams@simtel20.arpa
Subject: request for info

Two elementary questions from a novice:

1. What is a good reference book giving characteristics of various types of transisters?

******* Most transistor manufacturers publish reference books on their own products, and often include cross-reference lists to type numbers which they don't supply so you can pick one of their products to substitute. Often these books have fairly hefty prices printed on them, but don't be fooled: they really are intended to be given away to good customers. If you work for a company that buys electronic components, or if you KNOW someone who does (and what ham doesn't!) you can probably wheedle a free copy of such books with a little diplomatic effort. And don't feel guilty, the goodwill and future sales of the product are worth it to the transistor manufacturer! After all, YOU might work for Zenith or DEC or IBM some other day even if you don't now!

You might also write or call Semiconductor Specialists in Elk Grove Village, Illinois. They probably will send you some useful catalogs, cross-reference lists, etc.

Other sources can be found by browsing at your local radio store's bookshelf. Also, the Radio Amateur's Handbook always used to have tables of tube and transistor parameters at the back. Is this still true???
******

2. Is there an outfit (there must be) from which you can mail order components (I particularly need some small coupling transformers, Radio shack doesn't seem to have them in their catalog)?

Is there a way to measure the inductance of a home-made transformer?

****** Try to get hold of a catalog from Newark Electronics (I think they are still around, based in Chicago) or Schweber or Page or Gerber (in Norwood, MA) or many other places. Most of 'em will gladly ship a mail order to an individual. Can anybody suppply addresses and phone numbers? I can if you persist.

As for measuring inductance, there are instruments (reactance bridge, Q-meter) designed to do it, but you can do it simply if you have an AC signal source by making an LC tuned circuit and finding its resonant frequency. For RF, the easy way to do this is with a "dip meter" (formerly called a grid-dip meter until they did away with grids). It's worthwhile to buy a dip meter if you can find one at a price you like, maybe at a flea market or something. You will get a lot of use out of it if you are inclined to experiment with circuits and antennas etc.

If you don't have a dip meter and don't have a tuneable signal source, you can still make a measurement by getting an AC current to flow through the transformer winding and measuring the current and the AC voltage across the winding while the current is flowing. This will let you calculate the winding's reactance and from that its inductance.

From your question, I suspect you are talking about audio transformers. For this case, you can use 60 Hz from the power line as a signal source if you have nothing else. However, you should be careful how you go about it, as the voltage is hazardous. If you have ANY other option, such as borrowing or buying an audio signal generator, I would recommend you do so.

If you HAVE to use the AC line as your signal source, one way that can be used safely IF YOU ARE VERY CAREFUL would be to run one wire to a known ground, either at the AC outlet or elsewhere, and then make up a test cord with ONLY ONE PRONG connected. When you plug this in, you either get ground (no voltage) or the hot lead. You reverse it until you get voltage. By connecting your ground lead separately DIRECTLY TO GROUND, you make sure you won't ever get voltage on what you thought was your ground lead and therefore onto the cases of voltmeters etc.

Run the hot lead to a voltage divider that can be something like a 10 K Ohm, 2-Watt resistor on top and a 1 K Ohm resistor from the bottom of this to ground. This will take the 115 volts down to about 12 volts measured across the 1 K Ohm resistor to ground. Be careful to do all this in such a way that you are unable to touch the 115 volt points after you have wired it all up and before plugging it in. Electrical tape could be used to cover up points that will be "hot" before plugging it in, for example.

Now the 12-volt rms signal taken from across the 1 K Ohm resistor can be fed into the inductor for measurement purposes, and you can work safely with this signal without fear of a shock. Run a wire from the 12-volt output of the voltage divider to one side of the transformer winding whose inductance you wish to measure, and run the other side of the winding through a resistor or other known impedance to allow you to measure the current. (If your meter will measure AC current directly, then you can just wire the meter in the circuit instead of the resistor. But it is best to make sure that the current doesn't change when you include the meter in the circuit! If you can leave the current meter wired in and measure the voltage across the inductor with a separate meter, that's best.)

Once you know the voltage V across the inductor with a known current I running through it, you find XL by computing V/I. Then you can find L by computing L = XL / (2pi f).

PLEASE NOTE THAT THE PROCEDURE DESCRIBED CAN BE HAZARDOUS IF YOU ARE AT ALL CARELESS IN CARRYING IT OUT. PLEASE NOTE THAT

I RECOMMEND YOU TRY TO FIND ANOTHER WAY SUCH AS BORROWING EQUIPMENT DESIGNED FOR THE TASK. PLEASE ADVISE YOUR HEIRS BEFORE THE EXPERIMENT THAT I WILL TAKE NO RESPONSIBILITY FOR ANY HARM TO THE EXPERIMENTER! (Whew, I hope that clears me if you goof!)

Good luck
-John S., W3IKG

I have an antique Hallicrafters SX-28 `Super Skyrider' general coverage short-wave receiver that I used play with when I was in high school. It is a good receiver and since it won't cost me much, I would like to have it operating again, but I seem to have lost my manual and I do not remember which tubes it uses. I recall seeing a list of its tubes in an ancient CQ (QST?) or an old ARRL Handbook. Can an old-timer help me out? Thanks much in advance...

newington ct may 10, 1985
to all radio amateurs bt

china. by1qh has been on 14226 khz at about 2345z with w7pho. qsl to box 2654, beijing. by1pk was on 14060 khz at 0045z last saturday.

mali. lz6fe showed up on 14188 khz at 0030z. qsl to dl4bc.

marshall islands. dave, kx6dc, has been quite active recently on 14227 khz around 2330z.

central african republic. tl8ck has been worked on 14205 khz at 2200z.

turks and caicos. gary, wb8yuc/9vp5 has been on 1833 khz at 0030z.

bahrain. a92p was worked on 3799 khz last night at about 0100z.

easter island. ce0fqv, fernando, is on 14188 khz around 0100z. qsls go to box 59, easter island.

macquarie island. vk0gc continues to be active on 75 meters. look for him on 3795 khz at 0100z.

alaska on 160. kl7bus has been worked on the east coast recently on 1834 khz at 0530z.

greece on 160. sv0aa has been worked on 1835 khz at 0300z.

dxcc desk/cyprus. a list of zc4 call signs good for uk sovereign base areas credit is still being compiled. operations from either dhekelia or akrotiri are good. this is an updated list of the zc4s that have been found to have operated from the uk sovereign bases. zc4s ak, akr, asg, au, bi, cb, cu, cn, cs, ct, cz, da, epi, es, esb, gb, gm, hc, hs, ik, io, ju, kf, lc, mr, mt, nl, pc, rb, rm, gp, sc, sj, ss, ti, tx, wd and ww. inquiries are still being made to determine the locations of others. please send any information you may have to the dxcc desk. see march qst, page 62, for details. submissions will not be accepted before june 19.

also cyprus. zc4ab has been active on 20 meters around 2100z.

cocos island qsls. wb4ubd is qsl manager for the february 1985
ti/tty dxpedition only. ti9j qsls go via ti2j.

sweden. to celebrate the 60th anniversary of the ssa, 7s1ssa
through 7s7ssa plus 7s0ssa will be active until the end of may.
there will be an award for working all eight stations.

saudi arabia. hz1hz has been active around 0300z on 7007 khz.

gabon. look for tr8ig on 3501 khz at 0115z ar

Does anyone out there yet know when Gaithursburg will be this year,
or the address of the sponsoring association?

                            tanner
ps: there don't seem to be a whole lot of hamfests down here in
     this area; at least not any to get listed in "73"

I am interested in building a directional antenna to replace my trap
vertical. The ARRL Antenna book contains plans for a log-periodic dipole
array. This caught my attention as an alternative to stacked monoband
beams. I have obtained the original QST article (Nov. 1973) and will try
to contact the author.

Does anyone have any experience with or knowledge of this type of antenna?
Does any commercial manufacturer offer one? If not, why is there no
commercial interest? Is there a fatal flaw in the design? The QST
article states that the author uses a transmatch to "eliminate possible
harmonic radiation caused by the frequency-independent nature of the
array." Is interference a major consideration?

Any help is greatly appreciated.

Thanks

Tom Swift

HAM RADIOS AND LEUKEMIA

reprinted from the New York Times

"Statistics turned up by Dr. Samuel Milham Jr., an epidemiologist for Washington State, suggest that ham radio operators may be nearly twice as prone to leukemia as the rest of the population."

"Reporting in a recent issue of The Lancet, Dr. Milham presented the results of a survey of more than 1,900 amateur radio operators in the states of Washington and California who died from 1971 to 1983. After obtaining death certificate information for 1,691 of the subjects, he discovered that 24 had died from various types of leukemia. The expected number of leukemia victims in a suitable matched control group would have been 12.6. The incidence of lymphatic and monocytic leukemias was not higher among the radio hobbyists than normal, but myeloid and unspecified leukemias showed sharp increases."

"Dr. Milham noted that in 1982 he had presented evidence of a link between leukemia and exposure to electrical and/or magnetic fields. His latest study, he said, offers 'some further support for the hypothesis that electromagnetic fields are carcinogenic.'"

"In a separate study reported in The Lancet, government researchers in New Zealand found the leukemia rate unduly high for occupations involving exposure to the electrical and magnetic fields associated with alternating current. Comparing 546 male leukemia victims with 2,184 men selected as controls, the group found the statistics 'generally support the suggestion that electrical workers are at increased risk of leukemia.'"

I would be interested in knowing what kind of shielding
was in the radios of those amateurs studied, what kind
of antennae they used, and how far away from them they
were. That is, if the report took those things into account.

     "Enjoying Radio" is a new publication for the SWL/ham

tinkerer. Editor and publisher David Newkirk, who also writes the Radio Equipment Forum column in the "Review of International Broadcasting", describes his new paper as:

> "....a running open forum concentrating on our personal enjoyment of and participation in radio and its effect on and place in our lives. It is thought of by its editor/publisher as centering on but not being limited to radio's technical side. Consideration of related topics, be they speculative, poetic, philosophical, satiric, dadaist or gaga, will also be included at the discretion of the editor/publisher...."

Subscriptions to "Enjoying Radio" are made in single increments of 240 pages only for $19.50 (US 1st class postage) and are available from:

Enjoying Radio
Box 85024
Seattle, WA 98145-1024

Some people will not enjoy "Enjoying Radio", but if you think you may, I recommend you first send for a sample issue ($1.75, check or US stamps ok) from the address cited above.

I am about to start a mailing list for discussion of packet-radio.
The list is intended to provide a forum where people can exchange
ideas and describe projects they are working on. The list will be
maintained on mit-eddie. Mail for the list should be sent to
packet-radio@mit-eddie. Administrative requests (addition and
deletion, etc) should be sent to packet-radio-request@mit-eddie.
mit-eddie can be reached through the internet, MIT's chaosnet, and via
UUCP ({decvax!genrad,ihnp4}!mit-eddie).

     RESIDENTS TAKE MICROWAVE FIGHT TO STATEHOUSE,
     Daily Record, May 9, p. B1. A dozen members of
     Citizens Against the Towers brought their fight
     against microwave installations in Vernon
     Township to the N.J. statehouse Tuesday. The
     group cited unusually high incidences of
     cancer, miscarriages, Down's syndrome and other
     birth defects, although a 1983 study by the
     state Department of Health found no evidence of
     health hazards. AT&T-T, RCA, and American
     Satellite have built microwave towers in the
     Vernon Township area.

I dunno if we qualify as "experts" but of course flattering us will at least get us to try to help you!

I would have thought a line filter might help. Did you place it at the TV set or at the intercom? If you haven't tried both, you might do so. If it works at the TV set end, that's best because then you only need one line filter.

Does anybody know what frequency those FM carrier-current intercoms work on? I have some at home but have never bothered to look into this question, as mine have worked fine. It might be that the line filters supplied by RS aren't effective at this frequency. If that is the case, a more effective line filter (boughten or designed and built for the purpose) would help.

Does your intercom have an adjustable squelch setting buried on the bottom somewhere? You might cure the problem just by tightening up the squelch. This raises the question: does the buzz come on as soon as you turn on the TV even if the intercom is idle or only when the push to talk switch is actuated? My "cure" would only work if the former is the case, I think.

If line filters simply don't fix it, even with one on each of the three line cords involved, then the set is probably radiating junk pretty strongly at the intercom frequency. Then you might have to go in and modify the TV set in some way to fix it. My suspicions would run to an oscillation or ringing in some wiring in the TV set, excited by the vertical retrace signal - the very sharp waveform that makes the CRT beam zap up from the end of the frame to the beginning of the next one. This occurs at about a 60-Hz rate and has LOTS of harmonic energy in it. If a piece of wiring in the TV set's vertical sweep circuit is resonant near the carrier frequency of your intercom, this could radiate RF pulses at the vertical sweep rate of the TV, which could indeed be picked up as a buzz. Changing the length of this wire or "dressing" it close to the chassis or maybe replacing it with shielded cable could be solutions.

Another possibility is that some stage of the vertical sweep circuit is

breaking into oscillation at the intercom frequency during some part of its cycle. I would think you would see something funny in your TV picture if this were the case, but "only the electrons know for sure"!

If you can get hold of an oscilloscope for a weekend, you may be able to track the problem down more systematically: Look at the AC line where it connects to your intercom that is hearing the buzz and see if you see spikes on it when you turn on the TV set. If so, try to speed up the sweep and see if you can see the basic frequency of oscillation or "ringing" in the pulses. If you don't see anything on the AC line, tear your TV set apart and see if you see anything funny in the vertical sweep waveshape anywhere along the chain from the sweep oscillator to the CRT itself.

Anybody else got any ideas on this one?

Good luck, and get back to the net with info on where you put the line filters and such like if you need more hairbrained ideas.

Three possible sources of open-wire feedline:

1. Make it yourself. Various ham handbooks tell how to make spacers.
   Wooden dowel, drilled through the ends and boiled in paraffin to make
   it waterproof, was one way the old timers used. You tie the feedline
   conductors to the ends of the dowels with short wires through the holes.

Or use polystyrene dowel cut to suitable lengths or sheet cut into strips of suitable length.

With polystyrene you can use the same trick of drilling holes and tying the wires on, or you may be able to MELT the wires into the ends of the spacers, for example if you use bare Copperweld wire.

Another method I have seen used is to start with PCV tubing, available at any hardware or building supplies store. Cut it to the desired length of spacer. Then slice each short length of tubing on a band saw to get 4 or 6 or so spacer strips. Then notch the ends to a width just tight enough to force the wires into. Or use the melting method mentioned above. NOTE: Source #2 below used this method when he made some feedline for me a few years ago.

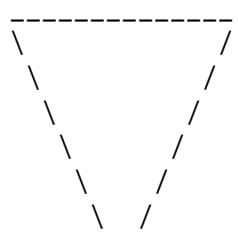
2. Dick Austin, of Austin Custom Antennas, PO Box 357, Sandown NH 03873, has been known to sell open wire feedline. I don't know if he is currently interested in doing so or not as he is now almost busier than he wants to be making antennas.

3. U-Do-It Electronics in Needham, MA, has rolls of OWL available. I don't know who the vendor is but I'm sure they could tell you and that the stuff is probably available a lot of other places.

This could be a good little specialty business for sombody who wants to go to the trouble. There are 400,000 lazy hams out there to buy the stuff, and every one of them is a potential customer as soon as they find out how one should REALLY feed an antenna! It's funny to see how the lore of open wire line has already been almost forgotten except by the guys with the REALLY big signals on 160, 80, and 40 meters. It's almost time for the world to "discover" this hot new technology for eliminating feedline losses and making antennas work well on all bands!

-73,
John S., W3IKG

P.S. Archeologists are working on a rumor that the ancients had some secret knowledge in antenna design, too. There is highly convincing evidence in the form of ancient Log Books that some hams used to have 20 over S9 signals in Europe on 80 and 40 meters! There is growing suspicion that the rumored "Delta Loop" antenna may have something to do with this performance, though the evidence that remains today is primarily in the suggestive shape the ancients chose for the ANTENNA SYMBOL in their religious diagrams:



\/

(Seriously, try a Delta Loop fed at the bottom with heavy open wire line on 40 or, if you have the sky hooks for it, on 80. You'll NEVER go back to trap dipoles, I guarantee you!)

MIKE,

MANY OF THE HAM RADIO SUPPLY STORES CARRY THIS ITEM IN STOCK ALTHOUGH IT
IS NOT NECESSARILY "OPEN WIRE" BUT RATHER IT IS WIDE SPACED INSULATED
"OPEN WIRE". IT IS AVAILABLE IN 300 AND 450 OHMS Z. THE OLD STYLE
UNINSULATED OPEN WIRE FEEDER IS RATHER HARD TO FIND. SUGGEST YOU CONTACT
DAVE HALLIDY AT A HAM RADIO STORE IN PLANO TEXAS CALLED "TEXAS TOWERS".
DIRECTORYINFO CAN GIVE U THE #. GOOD LUCK--

                                VAL L. ERWIN, W5PUT

+---------------
| ...bought a wireless FM intercom for my house (two-station). It works fine
| until I turn the TV on, then buzzes like mad. I tried a Radio Shack AC
| line filter, but that didn't have any effect at all. It also makes the
| noise no matter how far from the TV either station is.
| So, what is causing the buzz? ... And how do I quiet the little
| bugger down? | John (DINGMAN@RADC-20.ARPA)
+---------------

You don't say what frequency the intercom works on, or anything about
your T.V., so this is pure speculation:

Try cleaning the inside of your television very well, particularly the
high-voltage lead to the picture tube, and all around where it plugs
into the picture tube (especially the glass between the connector and
the conductive outer coating). There can be arcing or corona discharge
through the accumulated dust (which is naturally attracted to the high-
voltage D.C. areas) causing your RFI problem. The corona can also occur
in other parts of the high-voltage system.

** BE VERY CAREFUL! ** If you do not understand the safety precautions
yourself, don't attempt to do it. Get a hardware wizard or service person.
(There is a trick to discharging the tube, which can store a nasty shock.
While said technique is quite easy, I couldn't safely attempt a detailed
decription here, beyond saying it basically involves slipping a grounded
probe up under the insulated "nipple" of the high-voltage wire.)

Another possibility is that the one of the horizontal or vertical output
stages has a parasitic oscillation in the F.M. band (somewhat harder to
diagnose and cure). Borrow a wide-band receiver to check this one out.

Due to antenna restrictions, I use an inverted-L wire antenna and load it
on all bands (to 1:1 SWR) with a tuner. The nearly-vertical part of the
inv-L is about 70 ft high, and the nearly-horizontal part is 70ft high and
130 ft long. The "ground plane" (hi hi) under this wire antenna consists
of my station ground: an 8 ft copper-clad rod !! (and, of course, whatever
the earth of my back yard is doing).
     I like to work EU and SA on the low end of 40m and 80m, and I'd
LOVE to try working DX on 160m. Also, I want to maintain a sked between
DC and CT, which presently gives S7 sigs (100 watts TX) on 75m.
     Questions: if I lay some radials out from the ground rod,

     1. How many, and how long, to affect performance?
     2. Is it OK to bury plastic-insulated copper wire a few inches
           below ground surface as the radials?
     3. Will DX improve?
     4. If it does, will I be throwing away my DC-to-CT QSO due to a
        lower angle of radiation?

                         Bob Menton KG3J

KANTRONICS HAS A NEW ONE TO BE OUT IN APRIL. THE TNC USES RS-232 OR TTL.
ALMOST ALL OF THE CAMMANDS AND OPERATION PROCEDURES USED BY THE TARRPR GROUP
ARE USED WITH THE UNIT. BOTH THE AX.25 AND VANCOUVER PROTCOLS ARE INCORPORATED
IN THE UNIT. THE UNIT SUPPORTS 300,400,600,AND 1200 ,BUT DOES NOT SUPPORT
FULL DUPLEX. THE UNIT IS 1.9"H X 5.9" W X 8"D. THE PRICE IS $389.95.
THE INFO HERE IS FROM THE RELEASE TO BE PUT IN THE MAY HAM MAGS. ALSO THE
UNIT CAN BE USED AS A STAND ALONE 1200 BAUD RADIO MODEM.

The few FM intercoms I ran across operated near the 160-9190 kHz range.

Sounds like the problem could be harmonics of the TV's sweep circuits.

I would suggest a brute-force line filter on the TV set's power line.
I don't know if wrapping the TV power cord around a ferrite rod would
help or not. My RCA XL-100 has a transformer-type power supply but the
chassis is connected to one side of the line cord since the transformer
is also used as an autotransformer. I measured the horizontal sweep
signal being fed back into the power line with a Stoddard VLF rcvr
and it was quite high....

I believe the "simple" rules for radials are: The more the better, and
should be 1/4 wave long (some 1/4 wave long for each band for multi-
band antenna systems).

I have an inverted "L" also however mine is about 25'vert and 75' horiz.
I buried 5 radials which are fanned out from the base of the tower that
supports the L portion of the antenna. The radials vary in length from
50 feet to 75 feet. The radials are #12 insulated, stranded "appliance
wire". I don't think it makes any difference if the wire is bare or not.
I use this antenna on 160, 80, and 30 meters with no rf in the shack.
(about half-way out the horiz. portion I have a loading coil that tunes
it to just above the high end of 160 meters).

Any radials are better than none, regardless of length. I don't know what
it will do to the radiation angle.

I find myself desiring an antenna that has a funny patern, and the usual
HAM literature on antennas doesn't seem to cover what I want.

I run a packet BBS, and many of my users get to me via a distant digipeater.
They are in an area where there is no PBBS, and mine is closest to the
mountain mounted digipeater. The trouble is that the digipeater can hear
so well, that during busy times the path is not very usable, due to collisions
between my packets and those of stations who can't hear me at the digipeater
receiver. I don't want to increase power because the area north of Boston is
congested enough. I don't want to simply use a beam pointed at the digipeater
because I do have truely local users, and other PBBSs that I have a mail
forwarding relationship with.

What I would really like is a significant antenna gain in the direction of the
digipeater, without any significant nulls in other directions.

Any thoughts?
73's -Bill

Does anyone have information on the 'RF hats' which the Navy and Air Force
use to couple RF into their aircraft on the flight lines. I need to locate
a source of information on that technology.

Thanks in advance

John

Although I have had a lot of fun with my HW-16, I'd really like to get into packet radio. As the world of packet is new to me, I am searching for microcomputer software to make this possible, as well as good sources of general information. Does anyone have any tips on getting into packet and/or have knowledge of some sorts of packages in the public domain or otherwise I could use on my Apple ? (I can shoehorn anything from most any language ONTO the Apple, so that is not a big qualification, but if something was already set up for it that would be nice, of course.)

73's, Richard (formerly WN5PV0)

I WONDER WHAT THE POLARIZATION OF THE RECEIVING ANTENNA IS? ASSUMING THAT IT'S VERTICAL, I WOULD SUGGEST A VERTICAL ANTENNA FED IN PHASE WITH A VERTICAL YAGI. THIS WILL GIVE THE VECTOR SUM OF THE TWO (A CIRCLE PLUS A CARDIOID). THE ONLY FLY IN THE CARDIOINTMENT IS THAT THE YAGI HAS SOME MINOR LOBES WHICH ALSO ADD VECTORIALLY. I WOULD ASSUME THAT THEY'RE WEAK ENOUGH TO BE NEGLECTED.

HAVE FUN!

There are a couple of ways you can go.
1. Combine a directional antenna (yagi) with an omni antenna using a spliter has been used in commercial installations to control the pattern.
2. Use a collinear dipole array and skew the pattern by placing more dipoles on one side of the mast toward the distant mountain top.

A friend of mine once had a similar problem. He had several repeaters
(back when they were a new thing) on 6M linked and wanted local
general coverage and beamed coverage to the next link. He solved the
problem using a omnidirectional (ground plane, colinear, etc.) antenna
coupled to (and spaced on the tower appropriately) a 15 element yagi.
This created a "Keyhole" pattern and worked quite well. I don't
remember the exact coupling or spacing but you can probably find out
from a good antenna reference manual.

Has anyone had any luck interfacing an Apple IIc for RTTY use?
I have been unable to locate a schematic for the IIc to enable me to be certain that I correctly connect the TU (modem). The instructions that came with my RTTY program (Super-Ratt) indicate that I connect to the modem port (vs. the game port on a II+ or IIe), and that the interface be at TTL levels. Since the game port on a II+ is quite different from the serial modem port on a IIc in terms of its function, I am concerned that the proper circuit interface be made.

My Apple dealer has told me that a maintenance manual will be available shortly for the IIc for $50!(presumably including a schematic).

Thanks for the help.

PRO-30 Scanner Owner Arrested

The three TV networks presented film coverage tonight of the FBI's capture in Georgia of Mr. ? Pierce, a member of the right wing group "The Order". Pierce was wanted for the armed robbery of two armored cars.

Did anybody else notice the Radio Shack PRO-30 portable scanner lying amidst the guns, grenades, and banana clips confiscated by the FBI?

:-)

How about a vertical for the locals AND a beam pointed at the digipeater?
You would need to design a splitter/matching network but it sounds "do-able".

Jim

I am looking for a schematic for an R390A receiver. I will pay copying and postage costs. Also, has anyone had experience with the "partial repo of service manual" that Fair Radio and others sell? Does it contain enough info to be worthwhile?
Thanks in advance for any answers.

Anyone interested in my longwinded reply to menton's recent question on the above subject may request a copy thereof from me. The reply basically recommends alternative antenna configurations rather than radials for the existing one, but goes through quite a lot of "intuitive antenna theory"

in the process. Thus the length (250 lines or so) which inhibited me from appalling the entire net with it.

I would specifically appreciate comments on the long form by any sufficiently addicted antenna theorists that they would be unable to resist reading it!

73,
John S., W3IKG

Satellites on 149.985 MHz?

> I've been hearing signals that sound like satellite passes, on 149.985 MHz.
> I remember discussion on the net some time ago about Russian satellites
> on 150 MHz. Is this the same thing? (I hear sigs on 149.985 only; I've
> checked my calibration.) Do you have any info on what kind of data is
> being transmitted? Tnx in advance...

How much, if any, Doppler shift is there on the signals you hear? These records aren't that fresh, but there are non-terrestial stations listed.

I asked this question a few weeks ago, and I only got one response, so
I'm going to try one more time:

Do "call-sign" license plates increase the likelihood that your ham gear
will be stolen from your car? (The theory is that crooks will recognize
from the plates that the car contains expensive goodies.)

Let's make the following assumptions (which happen to apply to my car):

    (1) The car contains a 2-meter rig in plain view (not hidden or
    camouflaged in any way). There is also a 1/4-wave vertical
    whip, permanently mounted on the roof.

    (2) The car has a good burglar alarm, and notices to that effect
    are prominently displayed on the car.

    (3) The rig is insured (ARRL policy) -- just in case.

Surely there must be some people out there in "net.ham-radio" with
strongly held opinions one way or the other on this question. Please
share them with me via mail, and I will summarize to the net (assuming
I hear anything, that is).

Thanks.

To: All attending the ARRL Fourth Computer Networking Conference
From: Hank Magnuski, KA6M
Date: 24 March, 1985

Subject: Final list of presentations

The following is the final list of presentations to be given at the
ARRL Fourth Computer Networking Conference which will be in Moscone Center
in San Francisco on March 30th, 1985. The conference will be in Room 232,
and all attendees of the Computer Faire are welcome to attend.

The papers presented will be in the proceedings, available from the ARRL.

10:30 Opening Remarks and Keynote Speech
  Paul Rinaldo, American Radio Relay League

10:45 Pete's Packet Primer
  Peter Eaton, TAPR

11:30 Applications of Packet Radio Papers -

  "Packet Radio Development - 1985"
    Lyle Johnson, TAPR
  "The Implications of Traditional Operating Practices for Net Design"
    Gwyn Reedy, FADCA
  "Packet Radio for Distance Teaching in the Third World"
    Phil Gray, University of Oregon
  "Packet Radio and the National Hurricane Center"
    Joel Kandel

12:15 Papers from the Proceedings - Operational Reports

  "The Realities of Packet Radio in the ARS circa 1985"
    Harold Price, LAPG
  "The FADCA Gator Link 1"
    Howard Goldstein, FADCA, and Ted Huf, FADCA
  "EASTNET: A Year Later"
    Bob Bruninga, AMRAD
  "Computer Networking in Japan, 1985 and Onwards"
    Robert Richardson, Richcraft Engineering
  "Activity Report of Japan's PARNET"
    Yamazaki, et al

13:30 Technical Papers - Part I

  "TCP/IP: A Proposal for Amateur Packet Radio Levels 3 and 4"
    Phil Karn, AMSAT

"Addressing and Routing Issues in Amateur Packet Radio"
Phil Karn, AMSAT
"Of Virtual Circuits, Datagrams, and the Circular File"
Terry Fox, AMRAD
"CCITT X.224 Transport Layer Protocol Basic Description"
Terry Fox, AMRAD
"Communications Protocols for the Network and Transport Layers"
Gordon Beattie, Jr., RATS, and Tom Moulton, EIES
"Proposal: Recommendation AX.121NA, a Numbering Plan"
Gordon Beattie, Jr., RATS, and Tom Moulton, EIES
"X.3 and X.28 Protocols for Terminal Node Controllers"
Douglas Lockhart, VADCG
"AX.25 Net Operation in the Connected Mode"
Robert Richardson, Richcraft Engineering

15:15 Technical Papers - Part II

"The RUDAK Packet Radio Experiment for Phase III-C"
Karl Meinzer, AMSAT-DL and Hans Peter Kuhlen, AMSAT-DL
"Modifying the Hamtronics FM-5 for 9600 bps Operation"
Steve Goode, CAPRA
"The Frequency Agile Message System"
Dave Borden, AMRAD
"Packet Radio Timing Considerations"
Dave Engle, PPRS
"A More Watchful Watchdog for Microcomputers"
Paul Newland
"Another Application Note Describing a Low-Power RS232 Interface"
Paul Newland
"A Few Thoughts on User Verification Within a Party-line Network"
Paul Newland

1). I am in need of info on the heathkit "apache" transmitter model TX-1.
I have all of the schematics and building guides for it but need more info
on the sb-10 sideband adapter. Do any of them still exist? Does any
info still circulate on these? Can i get anything from anyone???
Not that i'm desperate but..just need to know.

2). National nc-303. adapters nc300c1, c2, c6. same problem.
need all info available....PLEASE.

I am willing to pay postage for schematics or helpful non-postable
info.

Has anyone out there purchased the new Sony 2010 Shortwave Receiver?
Up here in Canada it's priced at 489$CAN and I'm looking for
some reviews before I make the purchase. Has anyone seen a
review in any of the Ham magazines?

qst de k9eui
hr propagation forecast bulletin nr 13 from arrl headquarters
newington ct march 31, 1985
to all radio amateurs bt

the solar flux reached 80 on march 2 but fell back gradually in the past week, to 72 on march 31. it rose to 74 on the next day, and is expected to be in the middle to high 70s this week. probably because there were no large changes in solar activity,

there were no severe ionospheric disturbances during march. propagation was generally better than is usual for this season but 21 and 28 mhz showed the effects of the quiet sun to a marked degree. the dx spectrum was largely 1.8 to 14 mhz, except for recent days, when all continents were workable on 21 mhz, and there was one day of 28 mhz propagation to africa, as well as to south america.

activity in the sunspot group responsible for the late march flux rise dropped off markedly last week, but another active area is expected shortly. its principle effect may be increased geomagnetic activity, which will degrade east west propagation in the higher latitudes. te, or transequatorial circuits, especially to australia, new zealand, and the south pacific islands, will continue good on 14 mhz and lower frequencies.

the te scatter mode is producing good results fairly often on 28 mhz, and occasionally on 50 mhz. te activity has been noted only after 2100 utc on 50 mhz but the possibility of morning openings should not be ruled out.

traces of early spring sporadic e skip on 28 mhz point to the possibility of work by this mode soon on 50 mhz. it is not related to solar activity in any clear way and good seasons have been experienced in the lowest years of past solar cycles. it is most common in mid morning and early evening hours local time. skip distances can be anything up to about 1300 miles. signals may be very strong, but wide range fading and quick fade outs are common. when ionization is very intense there can be propagation on 144 mhz also, most commonly in june and july.

another seasonal mode for vhf and uhf dx is tropospheric ducting, now beginning to show up in the gulf states. transgulf dx up to 1000 miles or more was worked on 144 and 432 mhz march 24 and 29. 1296 and 2304 mhz have also been used with this mode.

american sunspot numbers for march 21 to 27 were between 21 and 0 with a mean of 13.1 ar

> -------

     For some reason, I am unable to   reply to you
     suc-
     cessfully   via electronic   mail,   so I'm posting
     this
     response.

There are thousands of users in the 45 - 60 MHz range, including an experimental contract station for SRI International to operate on 49.84 MHz, USA-wide.

Businesses and state and local governments have frequencies in this range.

You already know the 6 meter US ham band is 50 - 54 MHz. Channel 2 TV is in the 54 - 60 MHz range. Cordless phones (see attachment) operate in this range also.

There are US govt stations in the 46 - 60 MHz range also (e.g. US Navy at Scott AFB).

The FCC has released 10 new frequency pairs for cordless phones. The base / handset frequencies (MHz) are:

Ch	base	handset
1	46.61	49.67
2	46.63	49.845
3	46.67	49.86
4	46.71	49.77
5	46.73	49.875
6	46.77	49.83
7	46.83	49.89
8	46.87	49.93
9	46.93	49.99
10	46.97	49.97

This interim ruling will be in effect for 5 years. Future allocations will likely be made in other parts of the spectrum.

Cobra cordless phones use these and other frequencies:

Ch	Handset	Base
1A	or 1	49.83	1.69
7A	or 2	49.845	1.71
13A	or 3	49.86	1.73
19A	or 4	49.875	1.75
25A	or 5	49.89	1.77

Grove Enterprises (Brasstown NC) sells FCC records on
microfiche. That's your best source.

Hi,

Can anyone help me in find out I am trying to find outh
what satellite I am hearing an info. on others.

1) what Satellites that I am hearing on 150 Mhz

2) information on Satellites on from 0 to 550 Mhz
that are used for data and or scientific studies
especially one with studies on radiation, solarwinds,
and magnetic fields studies and where to find the
decode information.

I've been hearing signals that sound like a satellite on 150.0 mhz.
There is +- 5Khz doppler shift and it is going in the right direction
(-5 khz as the bird disappears) so this should rule out a command
station. It has a high inclination as I have seen it as high as
20 degrees elevation to the north of my qth which is located at
71.40328 w long, 42.62233 n lat.I have calculated that its period is
about 116 min (assuming that there is only one satellite). The data
sound like random send RTTY data with a 850 hz shift. There are burst
of varying lengths of "characters" that all seem random and I have
heard it for over 15 min. before LOS. The transmission are NBFM and
the signal is linearly pol.

I remember discussion on the net some time ago about Russian satellites
on 150 mhz. Is this the same thing? If so has anyone figured how to

decode the beast. There are also Navigational satellites on this freq.
could it be one of them (I have not check yet to see if there is a
similar transmission at the same time on 400 Mhz.)

> 150.0000   call?_____Satellites, Russian - telemetry heard about 100 minutes
                              for approximately 10 minutes duration [space] (B

According to the March QST there will be a conference in April that
should be of interest to weather satellite enthusiasts. It is called
the International Satellite Direct Broadcast Service Users' Conference
and will be held at the Holiday Inn at Baltimore-Washington
International Airport on April 15-19. For more information contact

Thanks to Bob Parnass we fortunate folks up here in Oregon
can not only catch up on the latest happenings at Rajneeshpuram
on broadcast radio and TV (after all, things have been a little
slow since Mount Saint Helens quieted down), but now we can tune
in our scanners and hear Sheela, or some other spokesperson
for the Baghwan, call
a public official a four letter word first-hand. Truly, this is
what the Information Age is all about. Thanks again Bob. ;-)

Greetings video buffs, I have recently installed a home satelite
receiver, and am over the initial shock of the awesome amount of

signals that can be received.

Using a Kenwood R-1000 I am able to recieve many data channels, phone conversations and fax signals, but the signal that interests me the most is netnews.

I understand that netnews is on the VBI (vertical blanking interval) of WTBS on Galaxy 1, channel 18. The book "Tune The Hidden Signals on Satelite TV" (available from Universal Electronics, 4555 Groves Rd. Suite 3, Columbus, OH 43232 614-866-4605) touches on teletext, and VBI information.

If anyone has experience in receiving ascii data over a satelite antenna or any articles about non-video signals available on any satelites, please let me know.

Thanks in advance, Joe.

I'm looking for information on higher bandwidth alternatives to modems for communications from our department to off-campus users. The technologies that I'm considering include using an otherwise unused cable channel, packet radio, and anything else you can suggest. I'm looking for pointers to existing systems in other cities, technical articles describing these technologies, and vendors of off-the-shelf equipment. Please respond by mail, and I'll post a summary later.

I got five replies to my question about whether having call-sign license
plates on your car makes you a more conspicuous target for thieves.
Thanks to everyone who replied.

The unanimous consensus of those who replied to me (admittedly, only
five people) was that call-sign plates do NOT seem to increase your
likelihood of being victimized.

One person suggested that call-sign plates might actually help protect
you -- because most thieves are out for CB radios and the like, rather
than the far less widely marketable ham gear, and anyone who recognized
ham plates for what they were would not want to waste his time stealing
stuff he wouldn't be able to unload. (This theory is admittedly contro-
versial, and assumes a certain level of intelligence that may or may not
exist among auto thieves in general.)

In any case, as I mentioned in my previous article, I have a good alarm
system on my car, and the equipment is covered by the ARRL insurance.

So, I guess I'll go ahead and order plates with my call on them. If
there is anyone out there who feels this is a cavalierly stupid thing to
do -- but who hasn't said anything yet -- my mailbox is always open.

Here are some excerpts from the local RCMA April newsletter, written by Ed Sirovy (IL-4):

Radio Communications Monitoring Association
Chicago Chapter Newsletter

Regency

"Plenty of Regency HX2000 and MX4000 radios were in attendance at our last meeting. Opinion was quite favorable."

"Now the MX7000 is out and I borrowed one and a laboratory to go with it. First the good news, 1/2 uv at 899 MHz before the Cushman quit. IT WORKS! Coverage 25 - 550 MHz and .8 to 1.3 GHz!"

"Now the bad news. It IS an extended MX5000. Scan rate is very slow and slower. Images are as expected: 200 - 550, double the xmit frequency and subtract 750
MHz IF and there is your image. 800+, double the xmit frequency and subtract about 750 MHz IF and there is your image!"

"Caught DuPage Sheriff and Toll Road at 954 with cellular telco nearby. I sent this info on the MX5000 images (200 - 550) to our technical editor last time and he sez he would defer publishing it till he got further info! That's as useful as Radio Moscow."

"This radio is hot. I heard the WCFL studio-transmitter link near 947 MHz. I was about 1 mile south of the transmit path about the same distance from downtown. Signal fluttered on the back of the set whip but the

receive sight uses a humongous dish."

"Cellular telco came in fine with BOTH sides of the conversation heard. Privacy of Cellular radio-telco is a MYTH. All the news people who ran out and got cellular carphones so as not to let the opposition eavesdrop got took."

FCC Microfiche

"The long expected format change is here. The FCC merged its broadcast, old format, marine coast, aircraft ground, Chicago regional study (of 5 years ago), microwave, 470 - 512, among others databases into one new file. Left out (thank goodness) was the ham, boat, and aircraft mobile files (900,000 extra entries). Also left out was the AM-BC direction antenna file."

"Microwave is especially large as receive sights are covered. Receive and transmit info includes azimuth, elevation and beamwidth. Also, all services, make and model of transmitter and antenna. Those who buy a copy later this year when it becomes available will find it more than double in size and price." [latest word from NTIS is that FCC announce another delay, so the fiche won't be available before May 1985! - Bob].

What About Bearcat

"....Uniden which bought out Bearcat from Electra is presently working off its contractual obligations. Electra had ordered parts for X many units and Uniden agreed to buy the manufactured gear. When this is gone, Uniden will be free to bring out what ever equipment it wants and it will take over manufacturing."

"While Bearcat was frozen, Regency took advantage of this weakness to buy everything it could find in Japan (1000, 2000, 4000, 5000, 7000)."

Odds 'n Ends

"Arizona may ban use of a 2-way radio while a vehicle is in motion.

US-Canada-DOD closing Pine Tree RADAR net.... FCC has proposed weakening cable-TV radiation standards, hope

APCO and NABER can stop this before there's another "Hillside"...."

The "netnews" that is on the WTBS satellite vertical interval
is controlled by, uh, me. It's part of the Stargate experiment
that I developed to test the various issues surrounding transmission
of netnews-type materials in a broadcast-type mode. Note that at
this time I do not have current netnews data running, though some
selected current materials may appear in the fairly near future.
Right now about a 100 or so demo messages from some months ago
circulate endlessly.

The encoding system used for the data is considered proprietary
by the satellite carrier (I don't even know the details) and in
any case will be changed in the fairly near future to an encrypted
system as part of an upgrade to newer decoding equipment (which
also has built in ECC functionality). As a practical matter, even
without encryption, extracting the data in a meaningful way is
a lot of work without access to the appropriate (proprietary)
LSI chips. Not impossible, but probably not worth the effort.

x
         PopCom's Alice Brannigan == Tom Kneitel?

     A friend, who is also a Contributing Editor for a regu-
     lar monthly column appearing in "Popular Communica-
     tions", insists that Alice Brannigan is a pen name for
     Tom Kneitel.

This is hardly surprising, just disappointing.

Is Tom Kneitel still around? I used to read his columns in
Electronics Illustrated YEARS ago.

I still remember one of the letters he answered:

"I have this strange problem. I hear telephone calls in my head.
I hear the ringing, the answering, the conversation, and the parties
hanging up. This is very annoying. What can I do?"

--- "Get an unlisted head."

The MIT Radio Society and UHF Repeater Associations will conduct
a volunteer exam session for all classes of Amateur license. The
session will take place on Thursday, Aprli 18 at 7:00 pm.
Address: 77 Massachusetts Avenue, Cambridge. Bring with you to
the exam: a completed FCC form 610 (provided by you), and $4.00
for the exam fee. Also required will be two forms of
identification. Please contact Craig Rogers, WA4C at either (617)
225-6616 or (617) 494-8637 no later than Tuesday, April 16 if you
are planning to attend. A limited number of walk-in candidates
will be accepted, depending on space available. This is a W5YI
VEC exam session.

     In answer to a question about Moore code transmissions on hf

radio, I understand that there are still a few of these ARQ circuits in use, particularly by eastern block countries to and from Cuba.

Most are diplex (which is to say they transmit two channels of traffic bit wise interleaved in a crude form of time division multiplexing) and all are full duplex point to point circuits.

Moore code transmissions are isochronous self synchronizing bit streams consisting of bit interleaved (alternate bits from channel A and channel B) 7 element characters. Each character has exactly 3 mark bits and four space bits, making it possible to detect mutilated characters with any single bit error and many multiple bit errors. In order to make it possible for a receiver to distinguish channel A from B some of the characters are sent inverted (one's complement) with a different sequence of inversions used on channel A than on channel B. This pattern of inversions repeats every 8 characters, the channel A sequence is (IINI), while the channel B sequence is (INNN), the resultant sequence is abaBABaB (capital=noninverted=N).

Moore code characters consist of all 35 possible combinations of 3 ones and 4 zeros, 32 of those combinations map into the 32 possible characters of Baudot (Murray) code (most conventionally the CCITT alphabet #2 assignments), and the other 3 are used for error control and idle state indication.

In the past (1971) I copied Moore circuits running at 96 baud, or slightly faster than the 94.34 baud rate that it would take to encode two 50 baud 7.42 element code Baudot circuits. There were a few circuits running at 192 baud with 4 channels in use then, I do not know whether there are any still around. I suspect that many Moore circuits in use now still use these rates, but I haven't checked. 50 baud telegraph/telex circuits are a world standard. (A synchronous Moore circuit would have to run slightly faster than an incoming Baudot circuit to compensate for time wasted on retransmissions and allow for slight speed errors in the sending Baudot equipment, thus my memory of 96 baud seems right.)

All standard Moore circuits use ARQ protocol, which is to say that if the receiver gets a character in error it asks the transmitter to resend the character in error by sending a special character (the RQ or Signal I). The transmitter then resends the character, if I remember correctly along with a special idle character to mark the retransmission. This cycle repeats until the character is received with correct parity by the receiver. Since something must be sent when there is no traffic an idle signal is transmitted if no character is available from the incoming line. A different idle is transmitted if the other end of the circuit has lost sync. (Idlea alpha and beta). My memory of all of this is a bit hazy, but I think most Moore circuits are go back 2 ARQ, which is to say that they retransmit the character sent two characters before the one being sent when they see an RQ.

HF transmissions carrying Moore traffic are mostly single channel FSK 400/425 hz shift, although fdm multiplex Moore transmissions with channels

240 hz apart were used in the past (among other things to carry a backup circuit for the Moscow-Washington hotline). They can be received with a general coverage receiver and any ordinary FSK converter such as AEA CP-1.

Recovering traffic from a Moore signal requires some additional hardware or software or a combination of both beyond what is needed to recover normal Baudot or ASCII. The required functionality is some means of phase locking to the incoming bit stream, and recovering timing and sampling each bit at the center of a bit cell (baud).

This can be done on a microcomputer system by a real time clock driven interrupt routine (software phase lcoked loop) that samples the incoming digital signal every tick of say a one millisecond real time clock and from those samples computes which sample is closest to the center of a baud, and exactly how many ticks and fraction of ticks a baud is and so forth. Such a routine is not difficult for an experianced real time programmer to write, and many micro systems have suitable real time clocks. Probably such a routine would have to be in assembly language because of the relatively tight timing on a slow microcomputer. A number of AMTOR programs (which handle a very similar signal) use this technique, and if one should have source of one one probably could easily modify it to lock onto Moore transmissions. I understand that software phase lock loops have also been used for packet radio AX-25 HDLC recovery so such code may be in the public domain somewhere.

The other method of recovering timing is to use one of the bit-synchronous USART chips which have integral digital phase lock loops to lock onto the signal. My favorite (we use it at CRDS) is the Zilog 8530 SCC. This chip can be programmed to recover 7 bit characters and to lock onto the bit stream given an approximate baud rate. With clever programming it ought to be possible to start the SCC chip at the beginning of a character (by trial and error) so that it delivers a stream of 7 bit characters directly (or halves of 14 bit diplexed characters).

Recovery of the information once one has a stream of bits (or characters) requires software that acquires lock onto the 4 marks/ 3 spaces framing of a character, detects the channel A and B inversion sequence (in case of diplex - the most common case) and translates the characters from Baudot code to ASCII and prints or displays them. This software is not very hard to write, and could probably be done in some higher level language for a micro, as there are only about 13.5 characters a second to translate.

This should deliver a readable copy of whatever was being sent (presuming it's not encrypted). It should be a slightly corrupt copy because of occasional go-back-2 retransmissions. I suppose that it is possible to eliminate some of those retransmitted characters by statistical filters based on the probabilities of pairs of identical characters being part of the text or retransmissions, but for casual curiosity that seems overkill. (Or one could monitor both sides of the circuit if one had the equipment and were suitably located).

It is possible to build hardware to do all of this - I

did so in 1971 using TTL SSI and MSI - but in this day and age one would have to be more than slightly crazy to try. It is also possible to use a microcomputer on a chip such as the Intel 8096 to do all of the work (it has nice counter timers and even a DPLL) and build a few chip micro system that takes the TTL or RS-232 output of a FSK converter and translates it and puts it out as ASCII on a RS-232 port. In general my advice would be to use an existing microcomputer system with minimum hardware (a real time clock if one isn't already provided, and a readable bit connected to the FSK converter) and do it all in software.

I would be interested in hearing what turns up on Moore, someday I am going to dig into the tty driver of the Charles River UNIVERSE system on which I am typing this and make it receive Moore transmissions (and blow the dust off my HF receivers in the process) but I haven't gotten around to doing it yet ...

Appendix

> What is the proper configuration for hooking up an MOV to a power
> line? (i.e. in series or in parallel?).

Parallel.

> If it hooks up in parallel to the power line, why wouldn't one MOV
> work for your entire house? It seems that it would, because all the
> lines in the house are connected to together in parallel.

That would work if you expect all the transients to be developed on the
wiring outside of your house. This may be a reasonable expectation in
some instances. However, if you are interested in protecting againt
lightning strikes nearby, there could be significant spikes induced
in the wiring inside the house.

The other problem with using one MOV for the whole house is protecting

the MOV's. MOV's are sort of like big zener diodes, in that
above a certain voltage, they start conducting heavily, but below that
voltage they don't conduct very much. Notice I said "sort of", because
they don't work on the same principle as zener diodes, nor are their
breakdown characteristics as sharp or as well-defined as for zeners.
Anyway, the problem is this: when the voltage across the MOV reaches
the breakdown voltage and it starts conducting, something has to limit
the current flow or the MOV will be itself destroyed. Typically, the
current is limited by the resistance and inductance in the wiring.
Since the wiring coming into a house is typically much heavier than the
internal wiring, it is not as effective at limiting the current into
the MOV as the smaller gauge internal wiring. This means you need a
bigger MOV.

The FT757 has an optional RS232 interface that I'm interested
in. Therefore the following questions:

1) Does anybody in netland have it ?

2) If so, could you describe its capabilities and how you
   are using it.

3) If you don't have it, but have more info on it, please let
   me know.

I have a friend who has acquired a Sugart 910 without manual. This drive
does not have the usual 50 pin, 0.100" centers paddle. Instead it has a 44 pin,
0.156" centers connector (like those used on KIM-1s, the expansion port of
VIC-20s, and commonly available at Radio Shack. There is a spot for the usual
9 pin power connector, but none is mounted, and the power etch does go to the
edge connector, so I assume it is intended to get it's DC there too. Can anyone
help us with the pinout? I don't relish the prospect of producing a schematic
from staring at the etch. (Might be fun though, this thing is a real relic,
there is only one analog IC on the board, the rest of the analog is done with
descrete transistors, in metal cans no less.)

         tnx 73s -Bill, KE1G

I am considering getting "call sign" license plates for my car, but I
am concerned that doing so might more overtly advertise the fact that I
am carrying expensive "goodies" in my vehicle -- thus making me a more
likely target for theft.

Is this a valid concern?

Since the rig (a Kenwood TR-7950) is mounted in plain view under the
dash, and since I keep the roof-mounted vertical antenna in place all
the time, I suppose someone so inclined could already determine that I
had ham gear in the car -- even without distinctive license plates.

Admittedly, however, having plates screaming "WA6SGA" for all the world
to see could attract unwanted attention from someone who might otherwise
overlook my rig.

In any case, I have a good car alarm (with stickers on the windows call-
ing attention thereto), and I also have the ARRL equipment insurance
policy (so inexpensive there's practically no excuse not to have it!).

So far, I've been lucky.

>Does anyone know of a source of reasonably priced magazine storage
>boxes? (I think ~$1.00 or less per box is reasonable.)

Quill Corporation, 100 S. Schelter Rd., P.O. Box 4700, Lincolnshire,
IL 60197-4700, (312) 634-4800, has these files starting at $10.68 per
dozen for the 11-3/4 x 4 x 9" size in fiberboard. The price per dozen
goes down in larger quantities. They have other sizes at a higher
price ($14.99/doz.) and more deluxe files at still higher prices.

You might look for an old boat-anchor like a Hammarlund SP600 series
receiver or an R390. Or even an old HQ-129-X, HQ-140, HQ-110, HQ-170,
or similar tube-type receceiver. Many of these are available at flea
markets for under $100, and they ar FAR better (if working correctly)
than anything new you could get for $100. Also, they will probably
retain their $100 resale value indefinitely, should you decide to
unload them.

GE also makes a surge protector suitable for connecting to a 120/240 v single phase residential service entrance. It is self-contained with a conduit nipple, and is attached to a knockout hole in the service entrance panel by the main switch (I don't remember the catalog number but any electrical supply house should be able to get it (or an equivalent made by a competitor) for you).

Looks like I will be at the Fourth ARRL Networking Conference. Does anybody know whether the Front Page Bar has Guinnes Stout? I'll take the stay up late challenge, but only if the west coast packeteers will match the potency of my brew.

73's -Bill, KE1G

To all those who would like to be able to 'lock up' their equipment
there are two neat circuits, both of which can be built in the space of
a nine volt battery (less keyboard) using mostly spare parts (all mine
were found in the spare parts bucket.) in the spring 1985 edition of

C&E hobby handbooks, 101 electronic projects

one circuit uses time limited and gates then a s.c.r. to trigger a relay,
and the other uses 2n3906 transistors to trigger a few s.c.r.'s (one for each
digit in the combo).

they are worthwile projects, and if you want to stop others from turning on
your stero, kilowatt linear, home computer, or whatever, then these locks are
ideally suited to your needs.
I use mine to stop my room mate from using my computer! (he is a little upset
right now.)

regards,
Andrew Rahme.

The TH-21AT is a nice little rig. It really is as small (and hence
convenient) as they say -- shirt-pocket size. The power difference
between it and "normal" HT's is negligible -- less than the difference
between a rubber duck and a 5/8 whip, say -- and the price is right,
On the negative side, it's not compatible with anything else,
necessitating additional expenditures for battery packs, antennas, etc.
(the antenna socket is essentially RCA phono with screw threads).
Also, the Kenwood leatherette case is a little unimpressive and the
buttons are a little small, at least for my fingers. It does have a
full 16-tone pad (unlike, e.g., the IC-2AT, which has only 12) -- the
extra tones are used by new repeater hardware, so it really does matter.

My YL and I have had one for a couple months; we like it enough that
I've been thinking of getting another just because it's so handy.
(And Lord knows I don't need another HT lying around just for its
own sake -- I've got three or four already, which are now being "put
out to pasture" as dedicated packet transceivers or left in my briefcase
"just in case.")

I'm an amateur radio operator but I've been inactive for some time. Lately, I've been thinking of getting back on the air and I thought it would be nice to get into packet radio.

I've noticed that there are many programs on Simtel20 related to Ham Radio but I was wondering, what kind of hardware do I need (besides a Transmitter-Receiver) in order to get started? Where can I get it? How much do I have to spend?

I know I'm asking an awful lot of questions but, if you could just steer me in the general direction of some answers I would be most grateful. Thanks very much.

In addition to call letters, Illinois ham plates have the words HAM RADIO embossed on them. If a thief didn't see any signficance in the plate AJ9S, this extra verbage may help attract his attention. :-)

> I am considering getting "call sign" license plates for my car, but I
> am concerned that doing so might more overtly advertise the fact that I
> am carrying expensive "goodies" in my vehicle -- thus making me a more
> likely target for theft.

.....

> Admittedly, however, having plates screaming "WA6SGA" for all the world
> to see could attract unwanted attention from someone who might otherwise
> overlook my rig.

x
     The Sony 2010's are here! I saw the new Sony
     2010
     receiver at Spectronics ($279). Didn't have much time
     to put it through its paces, but it looks like a win.

     The digital display reads out to 100 Hz, and doesn't
     change when you alternate between usb and lsb. One
     detracting   note: as I turned the tuning   knob, there
     seemed to   be a noise burst each time the frequency was
     incremented.

     No problem copying SAC foxtrot broadcasts with built in
     telescoping antenna. The vhf-am aircraft band is a
     nice touch. Good fidelity on FM broacast.

     Anyone bought one yet? Let's hear about it.

Thanks to Bob Clements <clements@bbn-cd.arpa>, version 8.6 of the
W0RLI Packet Radio MailBox/BBS/GateWay system is now available from
SIMTEL20:

```
Filename           Type  Bytes    CRC

Directory MICRO:<CPM.PACKET>
PACKET86.LBR.1              BINARY   154112  68C9H
```

Here are Bob's comments about the package.
---
3 March 1985

Here are the files that make up version 8.6 of the W0RLI
Packet Radio MailBox/BBS/GateWay system.

There have been many changes since version 6.9 was posted to
the SIMTEL20 archives. A change history is in the file
NOTES.TNC. A few of the major ones are:

 1) The program has been converted to M80/L80 source language.
     It got too big for ASM/MAC.
 2) Automatic forwarding of mail among packet systems is
     supported. This requires a user list in the file FWD.TNC.
 3) The BIOS got too big, too. There is now a two stage bootstrap,
     with the second stage in the file CBIOS.COM, also as described
     in NOTES.TNC.

This system runs on the following hardware:

Computer:
     Xerox 820-1 computer (the ones that were available for $50,
                    and are still around for not much more),
     one or more 8" single density, single or double sided disk drives,
     parallel keyboard, CRT monitor.

Packet Radio gear:
     One or Two TAPR (or AEA) TNCs with version 3.1 or later software.
          (Two TNCs if you are going to run a crossband Gateway.)

Radio gear:
     One or two transceivers.

The W0RLI software supports sending, receiving and forwarding
mail, uploading and downloading files, capturing typescripts,
logging channel activity and mailbox activity, and gateway
operation between two TNCs on two bands.

Read the file NOTES.TNC to start working your way through the

documentation.

Hank, W0RLI, does not have access to ARPANET or Usenet. I will be glad to try to answer questions and/or relay questions and comments to Hank via 2 meters. You can reach me at
ARPANET: clements@BBN
Usenet: {ihnp4, linus, wivax, decvax, wjh12, ima}!bbncca!clements

Hank would appreciate knowing of users who are running this software. A QSL to Hank or a net message to me would be appreciated.

Here is Hank's update from the February 1985 NEPRA PacketEar:

The MailBox/GateWay has now been sent to 25 states and 5 countries. As far as I know for sure, it is on the air at least 20 places now. In the Boston area, 4000 messages have passed through it. The local forwarding network now includes 9 nodes: W0RLI, WB2OSZ, WB1DSW, K1BC, WA2RRKN-2, K7PYK, WA4SZK, KA1T, W1AW-4. The last two run their own software, but allow for forwarding from the W0RLI systems.

A message put into any one of these systems will find its way to the system nearest the intended recipient.

There are several other areas of the country now using the software: Georgia, Arizona, Iowa, Washington DC, Seattle, ENY/NYC/NNJ, Dallas, Illinois, Southern New Jersey, Los Angeles have all been heard from. All have the software in daily use.

Expect to see it on Oscar-10 at KL7GNG soon.

Look for it from Australia, New Zealand, Japan, Hungary.

Sacramento county RACES will be using it.

GateWays are running at W0RLI, K7PYK, WA4SZK and WB7DCH.

de Hank Oredson, W0RLI

I looked at some GE literature I have, and it appears that the
voltage rating is in terms of the DC voltage level at which the
MOV starts conducting. GE gives both the DC and AC levels in
their specs. For example, for the V18ZA1, Maximum Continuous
Voltage: DC 14 V; AC 10 V RMS.

ASSEMBLY CONSTITUTIONAL AMENDMENT NO. 9

Introduced by Assembly Member Moore

January 30, 1985

ASSEMBLY CONSTITUTIONAL AMENDMENT NO. 9--A resolution to propose to the people of the State of California an amendment to the Constitution of the State, by amending subdivision (a) of Section 2 and Section 13 of Article I thereof, relating to electronic communications.

LEGISLATIVE COUNSEL'S DIGEST

ACA 9, as introduced. Moore. Electronic communications: information systems and data bases.

The California Constitution guarantees the freedom to speak, write, and publish on all subjects and prohibits abridgment of the liberty of speech or press.

This measure would guarantee the right to electronically communicate on all subjects, and would provide that a law may not restrain or abridge liberty of electronic communication.

The California Constitution also guarantees the right of the people to be secure in their persons, houses, papers, and effects against unreasonable seizures and searches. A warrant may not issue unless, among other things, it particularly describes the place to be searched.

This measure would extend the search and seizure guarantees to electronic information systems and data bases, as defined, and provide in this regard that in order for a warrant to be issued, the electronic information system and data base be particularly described.

Vote: 2/3. Appropriation: no. Fiscal committee: no. State-mandated local program: no.

RESOLVED BY THE ASSEMBLY, THE SENATE CONCURRING, That the Legislature of the State of California at its 1985-86 Regular Session commencing on the third day of December 1984, two-thirds of the members elected to each of the two houses of the Legislature voting therefor, hereby proposes to the people of the State of California that the Constitution of the State be amended as follows:

First--That subdivision (a) of Section 2 of Article I thereof is amended to read:

SEC. 2 (a) Every person may freely speak, write [and], publish, ***or electronically communicate*** his or her sentiments on all subjects, being responsible for the abuse of this right. A law may not restrain or abridge liberty of speech [or], press, ***or electronic communication.***

Second--That Section 13 of Article I thereof is amended to read:

SEC. 13. The right of the people to be secure in their persons, houses, papers, [and] effects, ***and electronic information systems and data bases*** against unreasonable seizures and searches may not be violated; and a warrant may not issue except on probable cause, supported by oath or affirmation, particularly describing the place ***or electronic information system and data base*** to be searched and the persons and things to be seized.

An electronic information system is any combination of telecommunication and data-processing devices and procedures used for the collection, manipulation, and distribution of information. A data base is the information organized and maintained within an electronic information system.

(This bill must first be passed by 2/3's of both houses, then receive an affirmative vote of voters in a general election.)

I would recommend changing the Lithium Battery with the radio powered on, i.e., let the radio hold up the ram while you're swapping batteries.

Last week, Bob Parnass posted a message on setting frequencies outside the band limits of the R71A. The computer interface can be used for this purpose on the 751, 271, and 471. If I remember correctly, the radios only cover 1 MHz above and below the band limits before folding takes place, and you can only tune towards the band limits. For greater coverage, you need to change the band limits themselves; I changed my 271 from the standard 143.8-148.2 MHz to 140-150 MHz.

Finally, for satellite users, the computer interface makes working satellites

a delight. Just tune the receiver and let a computer calculate and set the transmitter frequency.

to all radio amateurs bt

fcc has released a notice of proposed rulemaking concerning
cable television. the nprm, designated docket 85 38, asks for
comments as to whether the home subscriber quality standards
are still important, and comments as to whether signal leakage
limits are still required. the nprm proposes to increase the
cable tv leakage limit from 20 microvolts per meter at 10 feet
to 50 microvolts per meter at 3 meters. comments on this nprm
are due by march 29, 1985. formal comment requires the filing
of an original and five copies to the secretary, fcc,
washington dc 20554. the most useful type of comments would be
those incorporating test data and measurements of leakage which
has caused interference to the amateur service ar

the (garble) word on the special prefix for the ontario winter games is that amateurs in ontario may use the prefix cz3 from march 1 through 17.

the 1985 canadian repeater directory is now being prepared. please send repeater updates and corrections to bill bowman, ve4afo, 744 christie avenue, selkirk, manitoba r0a 2h9, or call 204 482 3402.

docs latest regulatory agenda includes plans to permit repeaters in the 29 to 29.7 mhz band, sstv in the hf bands, up to 6 mhz bandwidth for fast scan tv in the uhf and microwave bands, and foreign amateurs operating under a reciprocal agreement access to the top 2 khz of the 144 to 148 mhz band. other proposed changes would remove all power restrictions in the 1.8 to 2 mhz band, remove the oral examination requirement for the amateur certificate, provide for figures, punctuation marks and q sinals in the advanced amateur code test, and relax licensing requirements for the handicapped. a study is being conducted on the possible restructuring of the amateur service in canada ar

hr propagation forecast bulletin nr 9 from arrl headquarters newington ct march 3, 1985
to all radio amateurs bt

the gradual drop in the solar flux that began at 81 on february 19 ended on the 27th, at 70, the lowest since february 1. it

wavered between 70 ane 75 through march 3. there was very little visible activity on the sun all last week. to make propagation matters worse, there was a major geomagnetic storm on the 28th. this produced auroral effects in the higher latitudes and enhanced transequatorial propagation on frequencies below about 30 mhz, but made for poor high latitude communications over the arrl dx contest weekend.

flux readings close to quiet sun levels are expected to continue through march 6, after which a minor rise is likely. march is upon us for auroral propagation on 28 mhz and the vhf bands. a good auroral warning is a wwv k index of 3, and rising. weak and wavery signals are usually heard on lower frequencies, especially on high latitude paths, and late afternoon on through the night. the incidence of auroral conditions is not closely related to sunspot numbers. very intense auroras can occur in low sunspot years, as of present.

american sunspot numbers for february 21 to 27 were between 25 and 8 with a mean of 14 ar

I have compared an ICOM "rubber duck" with a Larceny (? I think they make it) flexible quarter wave, and there was a distinct difference in favor of the flexible quarter wave. We tried the antennas on two identical IC2ATs sitting on a restaurant table and with all four combinations of antennas, radios, and positions on the table, to show up any differences due to power output, standing wave patterns, or whatever. On several marginal repeaters, the quarter wave always brought up the repeater but the duck always did not. The result was the same, incidentally, in all four test setups (antenna on radio A or B and in position 1 and position 2 on the table).

Based on this test, I would recommend the flexible quarter wave as a better "standard" antenna than the duck.

I have also compared rubber duck antennas with telescoping 5/8 waves, and found an ENORMOUS advantage to the 5/8. The ones I have used were the Vocom and the Tuned Antenna Co. 5/8 waves. They seemed to work about the same. In tests between a Larceny mag-mount "Kulrod" 5/8 wave, mounted in the center of a car roof and the telescoping 5/8 waves, I couldn't see much difference when bringing up distant repeaters. The Larceny 5/8 wave is widely regarded as "about the best" 5/8 wave implementation around.

Note that the 5/8 wave antenna on a hand-held has a significant advantage over a 1/4 wave in that it is much less sensitive to ground planes.

Therefore it is reasonable that a 5/8 wave on a hand-held should do nearly as well as an ideally mounted 5/8 wave over a decent ground plane.

Note also that an ideal HALF WAVE should be even less sensitive to ground impedance and ground planes, because of its very high feed point impedance (assuming it is end fed). One source of a well-executed half wave HT antenna is Austin Custom Antennas of Sandown NH. (I can get his phone nr. but dont have it handy. Area code is 603, though.) This antenna should be excellent both for HT operation and for those "talk-in stations" you set up with a whip stuck on the back of your misappropriated mobile rig. As it is totally ground-independent, it should work happily on picnic tables or whatever. Its pattern should remain nearly ideal (this is characteristic of Dick Austin's antennas in my experience) in both HT and picnic table use.

73,
John S., W3IKG

I've had HAM tags and a scuzzy KDK 2m in my car for a while. I was
real careful about locking up the car (not that that does a whole lot
of good) because I feared that someone would steal it mistaking it for
a CB. Well it just sits there in a slide out bracket. All you do is
unplug the power and the antenna and away it goes. Someone broke into
my car, took a whole bunch of quarters out of the ashtray and the buck
knife in my first-aid kit and left the radio.

I have had my walkie-talkie ripped off. The guy who took it tried using
it as a CB. I convinced him to sell it back to me because it wasn't a
CB. I think he got sentenced to about a year.

You're right; in fact, the difference is often more than 6dB,
since some duckies have negative gain. My comparison was an
attempt to provide intuitive bounds on the expected performance
loss of the TH-21AT given its lower-than-average power. In fact,
I generally carry a 5/8 wave whip with me and swap antennas when
the going gets rough, despite the bulk of a collapsed whip vs. a
duckie.

By the way, it's instructive to consider the cost-effectiveness
of amps vs. antennas for most 2m work in the same light, while
we're on the subject. In general, if you have a 2m linear feeding
a tiny antenna you've probably wasted a lot of money. Not only
do you get more dB of transmit gain per dollar invested from a
good antenna, but you get the same gain improvement on receive,
too. Linears may be good for one's self-image, but if what you're
interested in is communication then there are usually some better
alternatives that could be explored first.

Subj: RE: New Hampshire hams need your Support to pass a law for us

To all New Hamshire Hams and Hams Across the Nation!

My name is Pete Virgona N1DHD ex KA2KSR/1. Over the last year
I have been trying to get the New Hampshire Legislature to get
 pass a law to get ham plates at a
reduce rate. the current rate is $25.00 and it is clasified as a vanity plate.
We want to have the plates clasified as special plates and reduce the fee to
$10.00 for the first year then $5.00 for the rest of the time.
 Please send your letters to gov sununu at the State house in concord n.h.
 03301
to your local state rep and to Rep Phil LaBombardi W1OMZ , at
  60 Indian Rock Rd Nashua NH

there was a bill intoduced in 1981 HR292-FN which was knocked down but
 I have gotten about 350+ petitions signed and sent to Gov Sununu and
 Richard Flyn Commisioner of Safety.

The time is getting near so your letter are a must!!

Please help our Cause !

I have the ARRL sending a letter also.

we need this.

Why should we have to pay $25.00 while national guard pay only $3.00??

thanks !

my DEC node is FSLENG::Virgona
my net node is decvax!decwrl!dec-rhea!dec-fsleng!virgona
Home # 603 659-6294
Work # 617 938-2301

As of 2/18/85 there are two bills which are coming up to have a public
hearing I will keep you posted as to when it will be we need your support
on this so come out and speak your mind!!!!!!

73's

DE

N1DHD ex KA2KSR/1

Epilog Dated 3/6/85

Below is some responses to my plea as you can see they are from states out

side the New England States so I want to hear from NH, VT, MA, CT, RI also. Keep those letters coming.

My Home Address is:
Peter Virgona N1DHD
172 Lita Lane
Newmarket, NH 03857

Again PLEASE GIVE MY CAUSE SUPPORT!!!!!!!!!!!!!!!

Subject: Re: License Status In California (what is it?)
Posted: Mon Feb 25 15:00:24 1985

Ham plates in California cost $15 initially (up from $3 before 1979), with no yearly charge. They cost $7 to transfer them to another vehicle. Vanity plates cost something like $25 (blue) or $30 (reflective white) initially with a $10 yearly charge.

> And speaking of RS232 Interfaces, does anyone have the one for the ICOM
> R71-A receiver? Or specs? My Macintosh is waiting...

The ICOM computer interface comes in two halves: The EX-xxx is an external parallel interface to the internal processor bus, and the CT-10 is (allegedly) a combination RS-232 interface and terminal unit.

I called ICOM in Dallas to find out the status of the CT-10, and was told that the CT-10 as sold in Japan only did 45 baud, and was therefore deemed unacceptable for the US market. The man I spoke to was trying to figure out the Japanese manual for the CT-10, in hopes of designing his own RS-232 interface.

The more recent spec sheets from ICOM on the R71A do not mention the CT-10, from which I deduce that they don't intend to either market the Japanese CT-10 or make a US version.

I have ordered the IR remote control, thinking that maybe I could figure out how to build an RS-232 -> IR -> R71A interface, but haven't gotten the unit yet.

There was a recent message to this list that implied that there are RS-232 interfaces to other ICOM equipment. Could these be adapted to the R71A?

If anyone else finds out more about this mess, please pass it on..

I am seriously considering putting together a weather satellite receiver

for 1691mhz and have 2 questions which perhaps some individuals in net-land could help on. I will summarize any mail received though I hope most reply will be to this group so everyone can share.

First question: Is there anything of interest transmitted other than cloud pictures and service information? Weather maps and radar summaries would be very nice.

Second question: Where can I get info on other services offered by NOAA such as: weather maps maybe via HF fax, video from local radar sites (somehow the TV stations get it I suspect via a dial up line), and any other public domain weather information.

With the TVRO signals due to be scrambled maybe this info might be useful someday to others on the net. Also my display device will be a PC so there could be some fun software to share.

Lastly should there be enough interest I would be willing to serve as a clearing house for a mailing list on the subject provided I can get to the users of interest from my network (usenet) connection.

In <4019@ucla-cs.ARPA>, I explained how I mounted a Kenwood TR-7950 in my 1984 Honda Accord hatchback by attaching the slide-mount bracket to a pop-out plastic panel under the center of the dash. I indicated that I

was having trouble with car vibrations causing the assembly to squeak and rattle, and asked for suggestions.

I got several replies -- one from a person who said he had done exactly what I described and had no problems at all. He suggested that I check again to make sure that the panel was pushed back in far enough so that the two metal clips on its far end (toward the front of the car) were securely in place.

So I took the panel out and wrapped electrical tape around the two metal clips (this in addition to the electrical tape which I had previously wrapped around the plastic tabs on the other end of the panel). I then put the panel back in -- making sure that the clips were firmly seated (I used a flat-blade screwdriver to give each one a final "oomph").

The "squeaky-creaky" sounds are now, for all intents and purposes, gone.

Just as an additional safety measure, by the way, I drilled a small hole in the center of the back of the plastic panel (between the metal clips) and wrapped a short piece of stranded, insulated wire through this hole and around a metal support just above the panel in the dash. I wrapped the wire around twice, then twisted the free ends together. The purpose of this extra support is to keep the panel from popping completely out of the dash if I should hit an excessively bumpy "dip" in the road (this actually happened to me once!).

Oh -- I'm still waiting for some feedback (ANY feedback) on my other article -- <4102@ucla-cs.ARPA> -- asking whether "call-sign" license plates on one's car should be shunned because they advertise you to car thieves. Of course, it's only been a week since I posted that one, and I understand that some sites still depend on the Pony Express :-} to get their news feeds.

a

I have been listening to some transmissions on the 6 and 7 Mhz bands in my
car using an oscillator/frequency converter i built some years ago. since
i find myself enjoying it again, i would like to know if there are auto
receivers (preferably with digital tuning) available in this country.
   I have been told that there are european recievers (blaupunkt,becker?)
like this but have never seen one. Can anyone help?

                    Thanks!

Thanks for the advice, Val. I built the Signetics 565 circuit in my lab,
but alas, it doesn't work!

The detector output of the average AM/FM radio is not high enough
to drive the 565. An additional stage of amplification is needed.

I spoke with the proprietor of FM Atlas, who had the same results
with the 565 circuit.

Please post details of the simple circuit you've been using to detect SCA
for 8 years. I might experiment with the XR2211 next, but it's a $6
chip. The 565 was on sale at Radio Shack for $1.19.

I can't see why more than one MOV would be necessary to protect the AC
power (hot to neutral), because I can't see anything that would drive
a transient from hot to ground or ground to neutral. Big, inductive
loads switching on and off (motors, relays) create transients from hot
to neutral. Any sources outside the building can only drive
transients from hot to both ground and neutral, because ground and
neutral are connected at the circuit breaker box. Assuming the
building is wired with grounded outlets, all three wires run in
parallel from the breaker box to the outlet, so even VHF radiation
can't drive a big differential mode signal. The only source I could
think of for a big signal from ground to something else is a lightning

strike to just one wire - and I wouldn't expect any MOV to handle
that! - Jim Van Zandt

No, the 02AT, 04AT use diodes soldered onto the processor board for
their personality. I have the impression that the reset button works by
disconnecting the battery.

There will be an electronic and ham radio flea market in parking lot C

of Foothill College on Saturday, March 9. The official hours are 8 a.m.
to 2 p.m., but it actually starts about sunrise. There is no admission
charge for buyers. The flea market will be repeated on the second
Saturday of the month through October.

Foothill College is located in Los Altos Hills, CA, at Interstate 280
and El Monte.

Subj:    RE: New Hampshire hams need your Support to pass a law for us

To all New Hamshire Hams and Hams Across the Nation!

My name is Pete Virgona N1DHD ex KA2KSR/1. Over the last year
I have been trying to get the New Hampshire Legislature to get
 pass a law to get ham plates at a
```

reduce rate. the current rate is $25.00 and it is clasified as a vanity plate.
We want to have the plates clasified as special plates and reduce the fee to
$10.00 for the first year then $5.00 for the rest of the time.
 Please send your letters to gov sununu at the State house in concord n.h.
 03301
to your local state rep and to Rep Phil LaBombardi W1OMZ , at
  60 Indian Rock Rd Nashua NH

there was a bill intoduced in 1981 HR292-FN which was knocked down but
 I have gotten about 350+ petitions signed and sent to Gov Sununu and
 Richard Flyn Commisioner of Safety.

The time is getting near so your letter are a must!!

Please help our Cause !

I have the ARRL sending a letter also.

we need this.

Why should we have to pay $25.00 while national guard pay only $3.00??

thanks !

my DEC node is FSLENG::Virgona
my net node is decvax!decwrl!dec-rhea!dec-fsleng!virgona
Home # 603 659-6294
Work # 617 938-2301

As of 2/18/85 there are two bills which are coming up to have a public
hearing I will keep you posted as to when it will be we need your support
on this so come out and speak your mind!!!!!!

73's

DE

N1DHD ex KA2KSR/1

Epilog Dated 3/6/85

Below is some responses to my plea as you can see they are from states out
side the New England States so I want to hear from NH, VT, MA, CT, RI also.
Keep those letters coming.

My Home Address is:
Peter Virgona N1DHD
172 Lita Lane
Newmarket, NH 03857

Again PLEASE GIVE MY CAUSE SUPPORT!!!!!!!!!!!!!!!

Subject: Re: License Status In California (what is it?)
Posted: Mon Feb 25 15:00:24 1985

Ham plates in California cost $15 initially (up from $3 before 1979), with no yearly charge. They cost $7 to transfer them to another vehicle. Vanity plates cost something like $25 (blue) or $30 (reflective white) initially with a $10 yearly charge.

Subject: Re: Automobile Ham call sign plates
Posted: Mon Feb 25 11:56:47 1985

My problem is that I can't get tags for my car bearing both the fire department insignia and my call letters. I have to choose one or the other. Even though FD tags are 4 dollars cheaper a year I go for HAM TAGS. More indicative of who I am, but I am always explaining to gas station attendants what they are as they write them down on the credit slip. There are also legal reasons why I want to keep my anonymity about being a fire fighter while driving down the road.

Subject: Re: Call-sign plates and theft?
Posted: Sun Mar 3 08:55:46 1985

In addition to call letters, Illinois ham plates have the
words HAM RADIO embossed on them. If a thief didn't see any
signficance in the plate AJ9S, this extra verbage may help
attract his attention.   :-)

> I am considering getting "call sign" license plates for my car, but I
> am concerned that doing so might more overtly advertise the fact that I
> am carrying expensive "goodies" in my vehicle -- thus making me a more
> likely target for theft.
.....
> Admittedly, however, having plates screaming "WA6SGA" for all the world
> to see could attract unwanted attention from someone who might otherwise
> overlook my rig.

Need a cheap and quick 2m groundplane antenna?

Recently I needed such a thing and laziness and lack of time
prevented me from 'doing it myself.' I took a walk to the
local Radio Shack and purchased a 20-176 ($14.95) "All band
base station monitor antenna." It just so happens that the
elements are the correct length for 2m fm work and the antenna,

at the end of 50 feet of good RG/8U coax shows an SWR of about
1.2 to 1.

The elements are stainless and the hardware is of fair quality.
The thing look like it could stand about 100 watts.

BRUCE,

I HAVE A 757 THAT I HAVE BEEN "TALKING" TO VIA MY XEROX 820-II COMPUTER
FOR SOME TIME NOW. I DESIGNED MY OWN INTERFACE USING A MOTOROLA MC1489
AND A
RAT SHACK OPTICAL ISOLATOR. I OUTPUT FROM THE 820-II COMM PORT (RS232)
TO
THE HOME BREW INTERFACE THEN INTO THE RICE BOX. WORKS GOOD BUT I AM NOT
COMPLETELY SATISFIED WITH THE SOFTWARE I GENERATED TO HANDLE ALL THE
OPERATING FUNCTIONS OF THE 757. IT IS NOT WHAT THE AVERAGE BEAR WOULD
TERM AS BEING "USER
FRIENDLY". THEREFORE, I AM IN THE PROCESS OF REWRITING.

AS FAR AS ACTUAL PWA FROM YAESU, I HAVE NEVER INQUIRED.

REGARDS,

W5PUT--VAL L. ERWIN

     Another SCA decoder can be made using the LM3089 or 3189 "fm if
subsystem". It contains IF stages quadrature detector, afc, agc,squelch
and first audio stage. It can accept uV input level signals so low
drive from your tuner is no problem. Simply add a 67kHz tuned input
and quad det. circuit, and it's ready!

Well, there is the Blaupunkt Berlin receiver (about $1200), which is
a really good AM/FM/SW receiver with tape transport. The radio tuning

part is on a stalk that sticks up. I've never seen one but I've
heard its pretty awsome. Most car radios in europe have longwave,
but SW is less common. I am also looking for a car stereo type
installation, and would like shortwave capability, but thats not
in demand in the US apparently. I have an MFJ converter, but thats
really not very satisfactory (and requires an analog tuned radio
to work)

Blaupunkt makes a car-stereo/tape-player that also receives the
short-wave broadcast bands. I don't know the model number, but I saw
one once in a Porshe 928--I think it came as standard equipment (?).

To: All packet radio stations
From: Hank Magnuski, KA6M
Date: March 9th, 1985

Subject: Fourth ARRL Networking Conference - Update

The following message is an update to the information bulletin issued earlier. Please note that times and places published in the previous bulletin have been changed, and the earlier information should be discarded. The Conference promises to be an important meeting, for as of this date over 20 packeteers from major groups around the country have made reservations and nearly 50 preregistration tickets have been sold. Plan to attend the social events before and after the Conference, as you will probably find that these informal gatherings are a good source of information and contacts.

The Fourth ARRL Computer Networking Conference will be in San Francisco this year on March 30th, 1985. The conference, co-sponsored by the American Radio Relay League and the Pacific Packet Radio Society, will be held in conjunction with the Tenth West Coast Computer Faire, which runs from March 30th through April 2nd at San Francisco's new Moscone Convention Center. The tremendous growth and interest in packet radio terminals, equipment, networks and applications promises to make this conference one of the largest and best attended of the conferences given so far. Here is some information you will need to attend this conference:

Location -- The Networking Conference and all activities of the Faire will be held in Moscone Center in downtown San Francisco. To attend the Conference you will need an entrance ticket to the Faire. All Faire visitors may attend the ARRL Conference at no additional charge. All sessions are open to the public, and persons with no previous knowledge of packet radio systems and procedures are welcome to sit in and learn what they can about this new area of personal computer networking.

Dates -- The Conference will be held all day Saturday, March 30th. The Faire runs from March 30th through April 2nd.

Times -- The Faire hours for sessions and exhibits are 10:00 a.m. to 6:00 p.m. every day. The Conference sessions will run all day Saturday, from 10:00 to 6:00. An exhibit booth demonstrating packet radio equipment and operation will be sponsored by the Pacific Packet Radio Society, and will be open all four days of the Faire.

Tickets -- On-site registration for four days is $20. On-site registration for one day is $12. Pre-registration for four days is $15. Through special arrangements with the Faire and the ARRL, a special pre-registration fee of $20 will purchase a four day ticket to the Faire and a complete set of

the ARRL Conference Proceedings. Send a check for $20 and a self-addressed stamped envelope to H. Magnuski at the address listed below. Any checks received after March 16th cannot be guaranteed the special rate. Checks received after that date will be processed if possible and your tickets will be available at the Friday night event. Make the check payable to H. Magnuski and send it to 311 Stanford Avenue, Menlo Park, CA 94025.

Conference Proceedings -- The ARRL Computer Networking Conference papers have been a primary source of information on developments in amateur packet radio and digital communications between personal computers. The Proceedings will be for sale at the Faire for $10, and may be obtained from the ARRL by mail thereafter. They are included in the special pre-registration package mentioned above.

Faire Events -- The West Coast Computer Faire has been the premier trade show in the development of the microcomputer industry. This tenth anniversary session promises to be jam-packed with sessions and exhibits on personal computing. Hundreds of leading manufacturers have signed up for the Faire, and there will be sessions and seminars on almost every aspect of personal computing.

Conference Events -- Times and places for all the networking conference are listed below:

March 29th - 8:00 to Midnite - Network Management meeting at the San Francisco Pizzeria, 418 Beach Street (near Taylor), San Francisco. From the Hotel Union Square take the Bay & Taylor Cable Car to the end of the line. Walk two blocks down Taylor and you're there. (Yes, when cable cars aren't being used as amusement rides, they can be used for public transit.) Everyone is welcome. This will be a test of how late the East Coast packeteers can stay up when beers >= 2. At least one East Coast packeteer has accepted the challenge.

March 30th - 08:30 - Breakfast at Tad's Restaurant, 120 Powell St., SF.

All technical sessions for the conference will be held in Room 232. This is in the East Wing of Moscone Center near 3rd and Howard.

March 30th - 10:30 - Opening remarks and Keynote - Paul Rinaldo, W4RI
10:45 - Pete's Packet Primer by Pete Eaton, WB9FLW.
11:30 - Applications of Packet Radio - Papers
12:00 - Applications panel session by Andy Cromarty, N6JLJ.
12:30 - Lunch break. You're on your own.
13:30 - Technical Papers on packet radio and digital communications. Presentations from the Proceedings, Part I.
15:15 - Technical Papers on packet radio and digital communications. Presentations from the Proceedings, Part II.
18:00 - End of technical sessions

March 30th - 20:00 - Conference dinner at New Joe's Restaurant, 347 Geary St. (between Powell & Mason), SF. Phone: 989-6733. We will need a count of those wishing to attend by noon on Sat.

March 30th - 22:00 - A WESTNET organization and planning meeting will be held immediately following the Conference dinner. Don Simon, NI6A, is organizing this session, and the location will be announced at the Conference.

March 31st - 08:30 - Breakfast at Tad's Restaurant, 120 Powell St., SF.

March 31st - 10:00 - Meeting of the ARRL Digital Communications Committee Location to be announced.

Exhibit Booth -- We will be giving demonstrations and explaining how packet radio works at our exhibit booth (833/835) on the main exhibit floor. Representatives from visiting packet radio societies are welcome to leave copies of newsletters and membership applications at the booth. Also, if you have any specialized equipment you wish to have shown or demonstrated, please bring it along and we will try to include it at the show.

Housing -- Bill Stevens, W6ZM, has reserved a block of rooms for visiting packeteers at the Hotel Union Square, 114 Powell Street, San Francisco, CA 94102. Telephone is 415-397-3000. This hotel is three blocks from Moscone Center, and is one of the least expensive hotels suitable for conference attendees. To get to the hotel, take the Airporter Bus from SFO (approx. $6.00) to the downtown terminal. The Hotel is two blocks away, and you can walk or take a cab. A shuttle bus to the airport stops at the Hotel.

The following hotels are close to Moscone and will have many Faire visitors:

Hotel Meridien, 50 3rd Street, San Francisco, CA 94103. 415-974-6400
This is a new 700 room 36 story hotel with a French accent.

Sheraton Palace, Market & New Montgomery, SF. 415-392-8600
This is the Faire Headquarters hotel, two blocks from Moscone.

St. Francis, Powell & Geary, SF. 415-397-7000
About four blocks from Moscone.

Faire Contacts -- Any questions about the Faire itself may be directed to Computer Faire, Inc. (A Prentice-Hall Company), 611 Veterans Boulevard, Redwood City, CA 94063. Telephone is 415-364-4294.

Coordination Frequencies -- There will be packet radio activity on 145.01 and 146.58 MHz. Voice channel coordination will be on WB6FDT/R, courtesy of the Telephone Pioneers. Frequency is 146.19/.79 coupled to 443.1(out)/448.1(in).

The members of the Pacific Packet Radio Society look forward to your visit, and sincerely hope you will have a pleasant stay in San Francisco.

73, Hank

Hi,

     I have an old Bearcat 210 scanner which I sometimes use to
monitor the 2 meter repeaters. I would also like to use it on the
lower end of the band but, unfortunately, it does not cover 2m
frequencies below 146 Mhz.

     Does anyone know how to modify this scanner to extend the
coverage down to the lower end of the band? Thank you.

                                        Dan Reigada, K4JWW

QST
HR DOT BULLETIN NR 23 FROM DOT HEADQUARTERS
TO ALL AMATEURS BT

IN ACCORDANCE WITH THE TREND SET BY THE FCC AND THE CRRL IN
DEREGULATION, THE DEPARTMENT OF TRANSPORTATION HAS DECIDED THAT THE RULE
REQUIRING VEHICLES ON PUBLIC ROADS TO DRIVE ON THE RIGHT SIDE WILL NO
LONGER BE ENFORCED.

IT WAS POINTED OUT BY THE DIRECTOR OF TRANSPORTATION, THAT THIS RULE
CREATES AN EXCESS AMOUNT OF FUEL CONSUPTION AND WEAR ON COMMERCIAL
VEHICLES AS WELL A NOT MAKING EFFICIENT USE OF THE ROADS. HE POINTED
OUT THAT, WITH THIS RULE NO LONGER IN FORCE, BOTH LANES OF A TWO-WAY
HIGHWAY COULD BE USED FOR TRAFFIC IN THE SAME DIRECTION WHEN THE
MAJORITY OF TRAFIC IS HEADED IN THE SAME DIRECTION. FURTHER REDUCTION
IN FUEL WOULD RESULT BY ALLOWING VEHICLES TO RUN ON THE LEFT SIDE OF THE
ROAD WHEN THE ROAD TURNS LEFT, THEREBY DECREASING THE DISTANCE THE
VEHICLE MUST TRAVEL.

A FURTHER SAVING WOULD RESULT IN LAW ENFORCEMENT, SINCE POLICE WOULD NO
LONGER HAVE TO PERSUE AND TICKET PEOPLE DRIVING VEHICLES ON THE WRONG
SIDE OF THE ROAD.

The American Radio Relay League, 225 Main St., Newington CT 06111 is one of the better sources of publications helpful to beginners in Amateur Radio. Also, if you can find a Heathkit store or an amateur radio supply house, they usually have a lot of things you can browse through. In particular, the League and several other publishers offer "license manuals" or "study guides" for the ham license examinations. These are worth studying to get the hang of the kind of questions you will be asked. Also, I think the League can now sell you a list of exam questions from which your own actual FCC exam will be selected.

As for general reading to get a background in radio and electronic theory to help you both pass the exam and design your own equipment, I would suggest the League's very popular Radio Amateur's Handbook and Antenna Handbook.

Two other less obvious sources: Look up the name Marcus in your local library's card catalog, author index. Marcus wrote several excellent books on radio in the 60s or so which are still among the clearest sources for beginners. His books may be "tube" oriented, but a lot of the theory is exactly (almost) the same. The second reference is the ancient but honorable RCA Tube Manual of the '60s or so. The beginning of it is an EXCELLENT "Schaum's Outline" of radio circuit technology which, though "tube-oriented", is still very true and useful as the basis for transistor circuit design. Here, you will learn about amplifiers, oscillators, discriminators and envelope detectors, rectifier circuits like half wave, full wave, bridge, etc. RCA may continue the tradition and offer some very helpful transistor and IC oriented educational material today, but I am not familiar with their current stuff so can't give a specific reference. Contact your friendly sales rep, make sure he knows who you work for, and drop some hints about how you would like to get copies of such literature! Note that Motorola, Signetics, National Semiconductor, and many others, all have such literature and also lots of "Application Notes" which you can get free and which are full of general technical information and also practical circuit design information.

Another place to find lots of information is the trade magazines like EDN, Elctronic Design, Computer Design, etc., most of which are free for the effort of filling out a subscription order card.

Good luck!

73,
John H. Sangster, W3IKG

FOURTH ANNUAL NETWORKING CONFERENCE

The Fourth ARRL Amateur Radio Computer Networking Conference, cosponsored by the ARRL and the Pacific Packet Radio Society (PPRS), was a complete success. More than half of the twenty four papers published in the proceedings were presented at the conference, with attendance around 100 throughout the six hour meeting. The PPRS/ARRL booth at the West Coast Computer Faire, including on-the-air demonstrations of packet radio at 1200 and 9600 bauds, generated a lot of interest. Several hundred handouts were given to interested Faire-goers, and a lot of radio amateurs who didn't know about packet radio stopped by the booth to see the TNCs in action. Congratulations to Hank Magnuski, KA6M

and the PPRS for coordinating a successful conference.

The Proceedings of the Fourth ARRL Amateur Radio Computer Networking Conference are available from the ARRL for $10. See Gateway issues 14 and 15 for abstracts of the papers of the papers in this 109-page volume of proceedings. Proceedings for the first, second and third conferences are also available for $8, $9 and $10, respectively. These publications provide a valuable record of the history of packet radio, what packet-radio experimenters expect from the future and diverse points of view on many technical issues.

TRENTON COMPUTERFEST

For those on the East Coast, there will be a large packet-radio meeting at the Trenton Computerfest, on April 20th.

1000 Opening remarks - Harold Winard, KB2M.
1010 ARRL remarks - Jeff Ward, K8KA.
1020 Introduction to packet - Jon Pearce, WB2MNF.
1115 Regional summaries of packet activity.
1245 Comparisons of packet-radio TNCs.
1345 Introduction to the W0RLI MailBox - Dick Kutz, KS3Q.
1430 Packet-radio expert-panel discussion with Tom Clark, W3IWI, Phil Karn, KA9Q and Mike Bruski, AJ9X.
1600 End of forum.

The room-number for the forum is not available at this time; just ask at the Computerfest administration booth or look for posters. If you would like to make a presentation during the "regional summaries," contact Jon Pearce, WB2MNF, at 609-953-1566, or Harold Winard, KB2M, at 201-361-6478.

Via WB2MNF.

DAYTON HAMVENTION

Packet-radio will be well represented at the Dayton Hamvention, April 26, 27 and 28. The Dayton packet forum will be held on Friday, April 26th from 2:30 P.M. until 5:30 P.M., in room 1. Six speakers will make presentations and answer questions from the audience.

1430 Introduction to the packet forum - Bob Neben, K9BL
1440 Telecommunications and the Amateur in the 21st Century - Rick Whiting, W0TN.
1500 Packet Primer, 1985 - Pete Eaton, WB9FLW.
1530 Report on the ARRL and packet-radio technology - Jeff Ward, K8KA.
1600 Update on TAPR - Lyle Jonhson, WA7GXD.
1630 PACSAT update - Harold Price, NK6K.

1700 Networking, bulletin-board systems, and the Xerox 820 computer - Terry Fox, WB4JFI.

There will also be display booths for each of the major packet radio TNC manufacturers, including TAPR, GLB, Heathkit, AEA and Kantronics.

Packeteers are encouraged to use 145.01 MHz (voice) as a coordination frequency.

Via K9BL.

KANTRONICS TNC

Kantronics, makers of several RTTY and AMTOR software/hardware packages, have announced the availability of a TNC, the Kantronics Packet Communicator. An early production model of the Packet Communicator was displayed at the recent Computer Networking Conference in San Francisco. The TNC is small, housed in a 2 X 6 X 8-inch cabinet, much like the cabinet for the Kantronics UTU.

Although Kantronics "took some cues from the TAPR TNC," the Packet Communicator is a new hardware design. The internal modem uses switched-capacitor filters and can be switched by software to provide either Bell 103 or 202 tones, with or without receiver equalization. Also, the Packet Communicator can be used as a Bell 202 modem, bypassing all packet-radio functions. The TNC can send and receive packets at 300, 400, 600 and 1200 bit/s, half duplex.

The Packet Communicator serial port can provide RS-232C or TTL signals, at 300, 1200 or 9600 bauds. Special packet-radio terminal programs for many computers will be available soon from Kantronics.

We welcome the Packet Communicator to the growing list of commercially-available TNCs. The Kantronics packet-radio motto? "Packet Made Easy!"

Via Computers and Amateur Radio.

PACKET RADIO AND FIELD DAY

Due to a letter to Gateway from Thomas Clements III, W1ICH, the ARRL Contest Advisory Committee (CAC) has approved a Field Day packet-radio bonus. Field Day rules will now read: "An additional 100 points can be earned by completing at least one QSO on packet radio during the Field Day period. The repeater provision is waived for packet-radio QSOs. A packet station does not count as an additional transmitter. On the summary sheet,

show packet radio as a separate 'band.'" This new bonus is in effect this year, thanks to quick action by the CAC.

Field Day, always a day of high visibility for Amateur Radio, is now a good time to show the public and the members of your Field-Day group the advantages of packet radio, Amateur Radio's newest mode. Show them that packet radio is no longer an experimental mode, but a valuable emergency communications tool. This Field Day bonus might also encourage some investigation of low-power portable packet stations. TNC, two-meter rig and portable computer might all be run from solar, wind or human power. Mr. Clements suggests that "the annual Field Day message be sent to the section manager by packet radio if possible. Perhaps some traffic handling nets could arrange to pick up messages from packet-radio bulletin boards."

If you have any interesting ideas for using packet radio during Field Day, send them along to Gateway. Also, be sure to take some pictures of your portable packet station for the QST Field Day summary.

Ed.

TRANSCONTINENTAL PACKET

At the meeting of the Board of Directors of the Pacific Packet Radio Society (PPRS) on March 21st, 1985, the following resolution was passed:

Whereas the PPRS was one of the first societies formed specifically to encourage the growth of computer networking via radio using all digital concepts and techniques, and whereas the San Francisco area was the site of the nation's first amateur digipeater, and whereas an even greater challenge faces the amateur radio community to establish a transcontinental link, the Pacific Packet Radio Society has decided to establish a unique award to encourage the completion of the first terrestrial transcontinental network link. This one-time award shall be known as the "Golden Packet" [Like the golden spike that completed the transcontinental railroad. - Ed.] and the regulations relating to it are listed below:

1. A transcontinental link must be established, with each terminus located within 100 kilometers of either the Atlantic or Pacific Ocean.

2. The system must consist of fixed terrestrial digital store-and-forward radio links using VHF (greater than 144.1 MHz), UHF or microwave frequencies. Use of HF, satellite, tropo, meteor-scatter or moonbounce channels is prohibited.

3. A valid two-way transmission and acknowledgment of previously

unknown information (256 characters or more) must occur in less than ten minutes.

4. This competition is open to licensed North American amateurs, and no commercial links or services may be used in the path. Club stations are permitted.

5. Proof of the exchange must be submitted to the PPRS. Proof must include a list of the stations in the link, their locations, frequencies used and a copy of the text exchanged.

6. The reward shall consist of a suitably engraved plaque with the names of all participating stations listed which shall be presented to the ARRL. Each participating station shall receive either a plaque or a certificate.

7. Final decision on the award is subject to review and approval by the Board of Directors of the PPRS.

From KA6M.

WESTNET MEETING

The second "official" meeting of WESTNET was held in conjunction with the Fourth ARRL Computer Networking Conference last week. The networking plans set forth at this meeting illustrate how most amateur packet-radio networks will advance. Several groups within EASTNET are making plans similar to the WESTNET plan. The following notes on WESTNET plans and the reasoning behind them come from Harold Price, NK6K.

"The primary purpose of the first WESTNET meeting was to put in place the best network possible with the technology then available. It was hoped that linking San Diego through Los Angeles to San Francisco would help generate interest at the endpoints and in the less populous areas between, and that the increased number of users would supply the resources to build a more sophisticated network. We are now ready to proceed with the first in a series of improvements: a 9600-bit/s network backbone.

"WESTNET decisions have been based on two concepts. First, use the best technology that is available, but don't wait for the next innovation that is coming 'real soon now.' Second, don't build anything that will make transfer to the next level of technology difficult.

"What technology is there to use now? There is still no agreement on network-layer protocols. There aren't even any working prototypes of network software. There is, however, a 9600-bit/s modem design, the ARRL lab's multi-port digipeater software, hundreds of users running 1200 bauds on two meters and a chain of seven digipeaters between southern and northern

California. Unfortunately, a frequency translation from 145.01 MHz to 145.35 MHz is now necessary between north and south.

"Phase I of WESTNET's 1985 plans is to install 145.01 MHz repeaters in southern California. This will remove the need for frequency translation, reducing the maximum number of digipeater hops to five, with only three hops between L.A. and San Francisco. This will result in an immediate improvement in network service.

"Phase II is to install multi-port digipeaters, 220-MHz radios and 9600-bit/s modems at each of the digipeater sites. Each digipeater will be linked to its neighbors at the higher speed and frequency, providing user access to that link via 145.01 MHz at 1200 bauds. This will avoid collisions between local traffic around each digipeater with traffic on its way to a more distant point. While not as good as a true network protocol, this will be much better than current, single-frequency linking.

"Since the multi-port digipeater is implemented on surplus Xerox 820 boards, WESTNET can switch to a true layer-three network when one becomes available. The Xerox 820 was designated as the target hardware for the first prototype layer-three network software.

"Once in place, WESTNET will allow a user to use the network as if it were a simple chain of digipeaters. The user will transmit and receive on 145.01 MHz. If he specifys more than one digipeater, his packet will be repeater between digipeaters at 9600 bauds on 220 MHz. The packet will be transmitted on 145.01 MHz by the last digipeater in the list. Standard digipeaters can be used on 145.01 MHz as far as necessary for a user to access a multiport digipeater site.

"It is expected that by 1986 and certainly by 1987, there will be a true network-layer protocol in place, and that the backbone network will move toward 1.2 GHz at 56 kbits/s. We also suspect that 145.01 network-access and digipeater capability will always be needed to handle entry-level users, as a redundant path for network resilience in case of emergency and to handle users in extreme outlying areas.

"It was agreed that the 220-MHz link frequency is 220.950 MHz. The modem standard is the K9NG 9600-bit/s modem. The controller is the Xerox 820 running the KE3Z multiport digipeater software. WESTNET technical coordination will take place on the W6IXU mailbox."

If you are interested in schematics of the K9NG modems, they are published in the proceedings of the Fourth ARRL Computer Networking Conference. The mulitport digipeater software is available for an 8" disk to Gateway at the ARRL. I hope that Harold's report provides some insight into how packet radio is

changing in areas where the activity is overflowing a single 1200-bit/s channel.

Via DR NET.

EASTNET GROWING

The addition of several new stations to EASTNET has connected the network from Ottowa, Canada, to Washington, D.C. The "missing link" in northern New Jersey has been filled by WA2SNA-2, installed by the Ramapo Mt. Amateur Radio Club. Now, mail can be forwarded from the W3IWI MailBox in Washington, through WB2MNF in southern New Jersey, and on up the network to WA2RKN in Hyde Park, NY, W1AW in Newington, CT, or any of the W0RLI MailBoxes in the Boston, MA area. Because of high local activity at many places in the network, real-time, long-distance connections often are impossible or slow. W0RLI-type store-and-forward messages traverse the network relatively well, though.

The W0RLI MailBox and GateWay software for the Xerox 820 has is providing much of EASTNET (and beyond) with packet-radio message service. All of the following stations are linked in this store-and-forward network:
W0RLI - Westford, MA
K1BC - Lexington, MA
KE1G-1 - Goffstown, NH
N1DKF - Cranston, RI
KA1T - Harvard, MA
W1AW-4 - Newington, CT
WB1DSW - Manchester NH
WA2RKN-2 - Hyde Park, NY
WB2MNF - Medford, NJ
W3IWI - Clarksville, MD
KS3Q - Baltimore, MD
AK3P - Hummelstown, PA
K7PYK - Scottsdale, AZ
WA4SZK - Florence, SC

A message placed on any of these PBBSs for a user of any of the others will eventually be forwarded from node to node to the proper MailBox. Routing tables are maintained (by hand) at each node.

To the north, the the Plattsburgh Amateur Packet Radio Association, a division of the Champlain Valley Amateur Radio Club, has installed some stations that link the Mt. Ascutney, Vermont, digipeater to Ottowa, Ontario. This path allows EASTNET stations to access a BBS run by Wayne Bruce, VE3FXI. For those of you on EASTNET who want to try out the path to Ottowa, use WA1TLN-1, KD2AJ, W2UXC-1 and VE3PAK. All of these digipeaters are on 145.01 MHz.

Via W0RLI, Ed.

DIGITAL COMMITTEE MEETING

The ARRL Ad Hoc Committee on Amateur Radio Digital Communication met at the Networking Conference in San Francisco. The most important issues discussed by the committee were protocol standards for TNC control possible standards for message format.

Doug Lockhart, VE7APU, is investigating the use of CCITT X.3, X.28 and X.29 protocols in amateur TNCs. Doug's paper in the conference proceedings outlines the need for a standard set of commands and messages on amateur radio TNCs. If TNC programmers used standard commands and messages, a single article could describe how to operate all amateur-radio TNCs. If standards were adopted and adhered to, applications programs like the W0RLI MailBox would could use any TNC. The Committee expressed its appreciation for the research that Doug had done and requested that he deliver a draft of a proposed standard as soon as possible.

Hank Magnuski, KA6M, and several other PBBS operators discussed how difficult it is to move messages from one network to another, because there is no standard format for presenting subject, destination, source and distribution information in a message header. The committee agreed to study the X.400 series of message protocols and attempt to develop a subset of these standards that would meet the needs of amateur packet radio.

From W4RI.

PACKET FREQUENCIES

The CVRA-Southeastern Repeater Association, Inc. coordinates repeaters in North Carolina, South Carolina, Tenessee, Virginia and West Virginia. CVRA has established 145.01, 145.03, 145.05, 145.07 and 145.09 as packet-radio frequencies.

SPECIAL ISSUE

This issue of Gateway is tailored to provide information to those attending the West Coast Computer Faire and the Fourth Amateur Radio Computer Networking Conference. We have attempted to provide an overview of packet-radio activity in the United States and a fairly complete list of U.S. packet-radio clubs.

PACKET RADIO IN 1985

The past year has seen packet radio grow from a few hundred isolated stations into a few dozen tentatively-connected local-area networks (LANs). There are now between 2,000 and 3,000 packet-radio terminal node controllers (TNCs) operating on the amateur bands. The following list of clubs gives a fair idea of where the activity is concentrated: The San Francisco Bay area and the Los Angeles basin are the hotspots of "WESTNET" activity. These two centers are linked by a string of mountaintop repeaters. In the Northwest, there are organized groups pushing packet radio from Vancouver, BC toward Northern California. There are two paths taking shape from West to East: Arizona - New Mexico - Texas - Arkansas, and Utah - Colorado - Nebraska - Iowa - Illinois. The Chicago-area has recently produced a 9600-bit/s modem (designed by Steve Good, K9NG) and promises to be a center of network development. The east coast from Washington, D.C. to Boston is tenouosly linked, and there are many areas of high activity along this "EASTNET." In the south, Florida has the largest packet-radio population, and Alabama and Georgia are beginning to come on-the-air. Terminal node controllers have

been sold in every state in the U.S. and in several overseas countries.

The U.S. is being covered by LANs, and the next leap for amateur packet radio will be to link these LANs using a "network-layer protocol." Many LANs are already linked in a store-and-forward mail network designed by Hank Oredson, W0RLI. Hank's MailBox software, running at dozens of sites throughout the world, forwards a message from one node to another, until the message reaches its destination. This taste of networking is driving several software and hardware teams in the development of real-time networking equipment.

If you are excited by the idea of an amateur data network, or if you have some use for such a network (emergency traffic, weather networking, message handling, etc.) contact a packet-radio group and join the fun.

Jeff Ward, K8KA, Editor.

NATIONAL ORGANIZATIONS

o The Amateur Radio Research and Development Corp. is a group interested in advanced amateur-radio techniques. Members of AMRAD have been responsible for many advances in packet radio.

AMRAD
P.O. Drawer 6148
McLean, VA 22106-6148

o The Amateur Radio Satellite Corp. has ongoing interest in the development of amateur packet-radio standards, and they are currently involved in the construction of PACSAT, a packet-radio satellite.

AMSAT 850 Sligo #601
Silver Spring MD 20910
301-589-6062

o The Tucson Amateur Packet Radio Corp. (TAPR) is best known for the TNC kit that it designed, tested and markets. With the TNC now being produced by two commercial companies, TAPR continues to be instrumental in packet-radio development.

CALIFORNIA

o Recently, the Sacramento Packet Group (SACPAC) became a special interest group under the Sacramento Amateur Radio Club, Incorporated. This club, W6AK, is the area's oldest ham club.

While Sacramento packet stations are able to get into the San Francisco Bay Area with moderate success, plans are to install a high-level digipeater in the Sierra Nevada this year which will allow for more reliable links into the Bay area and down the Coast Range. Even better, the digipeater is planned to be a major node in the proposed Central Valley chain which will provide North-South path through the center of the state. SACPAC is also working on a W0RLI MailBox in Sacramento which should be functioning on 145.09 MHz by early summer. SACPAC is coordinating with PPRS to ensure that operating parameters remain standardized not only between these groups, but also within the rapidly expanding group of newcomers to packet radio in this area. All local operations are on 145.01 and 145.03 MHz.

The Sacramento County Office of Emergency Operations plans to have a TNC installed by the end of this summer and is coordinating with the State Office of Emergency Services to establish links and work out details for use of packet systems in emergency and disaster situations. The plan is to have packet "teams" within the County's newly-revitalized RACES program and ARES. The teams would set up communications at appropriate sites during drills and actual emergencies. A good framework should be developed over the next year to accomodate the projected growth in this emergency network.

o LAPG is the local Los Angeles packet-radio club. LAPG runs a voice net every Monday night at 8:00 PM local time on 145.36 MHz simplex. Meetings are on the last Saturday of every month near the TRW swap meet.

Los Angeles Area Packet Group (LAPG)

P.O. Box 6026
Mission Hills, CA 91345

o The Southern California Digital Coordination Council (SCDCC) is an organization formed by the packet radio operators in Southern California to serve as a central point for communications between packet users and other amateur groups. It also serves as a clearing house for information on local packet activity. Membership is open to anyone; packet radio users are encouraged to join. SCDCC has a technical committee to help track and promote the rational growth of packet radio equipment, repeaters, gateways and protocols on frequencies assigned to packet radio.

SCDCC serves all of Southern California and has members in San Diego, Los Angeles, Ventura, Santa Barbara, Lancaster, Lompoc, and other areas.

SCDCC
P.O. Box 6026
Mission Hills, CA 91345

o The Pacific Packet Radio Society was one of the first North American packet-radio clubs. PPRS serves the San Francisco Bay area, and is the co-sponsor of the Fourth Amateur Radio Computer Networking Conference.

FLORIDA

The Florida Amateur Digital Communications Association is an organization interested in digital communication techniques such as packet radio. Since its founding in 1983, FADCA has grown to be one of the major regional packet organizations in the nation. FADCA members are from Florida, Georgia, and many other states.

FADCA provides a structure for planning orderly growth of packet networking, and has been designated as the agent of the Florida Repeater Council for administering packet frequencies and repeater sites. FADCA's newsletter, the BEACON, provides technical information and operating news to over 250 persons each month. FADCA is the coordinator of the SOUTHNET packet network which is rapidly expanding from Florida through the entire Southeast.

o The Radio Amateur Telecommunications Society provides support to amateurs engaging in packet activities. The group's activities include a packet software library and development of a cross-state trunking system to be incorporated into EASTNET. A directory of active amateur packet stations and facilities has been compiled and is available. Standards documents are kept in club files and may be distributed upon request. RATS is developing an interface between the private teleconference DR NET and the EASTNET packet-radio network. This interface should be operating soon.

TRENTON PACKET FORUM

There will be a packet radio meeting at the Trenton (New Jersey) Computer Fest on Saturday, April 20 (note the change -- some of the earlier publicity had indicated Sunday). The Mid-Atlantic Packet Radio Council (MAPRC) is sponsoring the packet sessions and the organizers are Harold Winard, KB2M and Jon Pierce, WB2MNF. There will be a panel of experts to answer questions about packet radio and presentations by representatives of various EASTNET LANs.

INTERNATIONAL PACKET ACTIVITY

Although this report and list were biased toward U.S. packet activity, there is considerable activity in Canada and overseas. Japan, the U.K., New Zealand, Australia, Germany and Sweden all have packet radio activity. Canadian activity-centers include Hamilton, ON; Vancouver, BC; Toronto, ON; and Ottowa, ON. Back issues of Gateway provide more information on international activity.

For those of you who will be in the ARRL 2m Sprint on Mon 15th Apr, I hope to
have some guys from around here working the contest. I started a 2m SSB
net about 5 weeks ago on Sundays at 8pm (Mon 0200Z) on 144.2Mhz and there
is now some interest in 2m SSB. We have had checkins from squares DO63,DO73,
DO62 (my QTH),DO72, DO81 and DO70. So you may hear activity from those
squares during the contest ... but not from me ... my 25 watts into a 5/8ths
ain't gonna make it unless the propagation is really tremendous.

I am interested in communicating with the various amateur radio sattelites. Initially, I would just like to receive from them and work out the bugs in reception and decoding of telemetry. I have a copy of ARRL's Sattelite expreimenters handbook, but I find that I occasionally need more info (specifically, what services are available on specific sattelites - Oscar 10, 11).

Can anyone recommend a source for this info, and would anyone involved in sattelite communication be willing to answer some more detailed questions about setting up a sattelite station?

Thanks in advance.

Dan:

Can't reach you via mail. You've probably heard this trick before:

> To listen on a frequency f (where f is in the VHF-hi or UHF range), program the scanner to

f + 2(IF),

to hear the image.

I use this method on the BC350 and BC300 to listen in on the 400 - 420 MHz band. Bearcat has used IF's of 10.8 and 10.85 MHz in their scanners.

> I have an old Bearcat 210 scanner which I sometimes use to
> monitor the 2 meter repeaters. I would also like to use it on the
> lower end of the band but, unfortunately, it does not cover 2m
> frequencies below 146 Mhz.
>
> Does anyone know how to modify this scanner to extend the
> coverage down to the lower end of the band? Thank you.

Anyone knowing of a ham-fest this summer in the mid-west (Michigan, Indiana, Ohio, Illinois, Wisconsin, Iowa and Kentuky) could you please send the place, date and any additional information that you know about the ham-fest. I will compile and repost to net. (yes I already have my Dayton tickets).

Any small Chicagoland and Indianapolis area ham-fests would also be nice.

Thanks in advance.

x
          McDonalds Using Two-Way Radios

     The local McDonalds restaurant is modernizing: counter
     workers are now using two-way radios to communicate
     with the cooks.

     Each worker wears a lightweight headset/microphone
     wired to   a small, white plastic box on the front
    of a
     belt worn on the waist. One of the two black pushbut-
     tons on the box is a   push-to-talk control. What
     appears like a large white battery pack is fastened to
     the rear of the belt.

     A worker implied that more than one frequency was being
     utilized.   I don't know what frequencies are used, but
     they could   be in the 46 or   49 MHz   range   shared
    with
     cordless telephones,   intercoms, childrens walkie-
     talkies, and "Talkmen" (tm).

     Anyone have more information?

Perhaps the best way to get basic info on amateur satellites is to pick
up a copy of the Satellite Experimenter's Handbook by Marty Davidoff,
K2UBC, ISBN 0-87259-004-6. It's available from AMSAT or ARRL for $10,
or you might be able to find it at your nearest bookstore. (Hint: if
you get it from AMSAT, part of the proceeds go to supporting the organization
that builds the satellites.)

I have just become interested in RTTY and have a question.

Can I use my modem (Vic modem to be specific) to receive Ascii Rtty
directly from my shortwave receiver? What would happen if I hooked up
the receiver output to the input of the modem and then just used a
terminal program? Does anybody out there have experience doing this?

Could I modify the terminal program to decode baudot also?

Re: Navy TTY sigs and news.

I haven't tried anything like this but if your goal is to decrypt the
news from the fleetsat you'd get a better news dump from any of your local
radio stations even if you listened for only 2 minutes.

The exercise is interesting but the content isn't.

hr arrl bulletin nr 26 from arrl headquarters
newington ct april 12, 1985
to all radio amateurs bt

the goddard amateur radio club, wa3nan, at the nasa goddard space flight center in greenbelt, maryland, retransmits live space shuttle audio. coverage begins within the hour before liftoff, and continues through the flight and until about an hour after landing. wa3nan will not be on the air during astronaut sleep periods. frequencies used are 3860, 7185, and 14295 khz ssb, and 147.45 mhz fm. wa3nan operates under a blanket waiver of section 97.113 issued by the fcc for the duration of all space shuttle flights. see happenings, november 1983 qst for detail of the waiver ar

qst de k9eui
hr propagation forecast bulletin nr 15 from arrl headquarters newington ct april 14, 1985
to all radio amateurs bt

in the first two weeks of april the solar flux was never above 73, and in 9 days ending april 14, there were five 70s and four 69s. this is about as close to quiet sun conditions ay we are likely to see in the next two years. if you were active on the dx bands last week you got a fair sampling of what propagation will be like much of the time through this spring and early summer. strong signals from europe and on other high latitude circuits will be missing on 28 mhz and rare on 21 mhz.

propagation north south, and on other transequatorial circuits, will be less effected. our southern states get the best break on this, but all areas will experience it to some extent. at the writers home in florida stations in central africa and the south pacific are heard every few days on 28 mhz. the south american path works just about every day. this is quite different from our conneticut experience, though the same areas are heard now and then up there, and south americans are fairly consistent.

with the coming of the sporadic e season, peaking in june and july, the possibility of working across the atlantic on 28, even 50 mhz should not be ruled out. there will be many hours of strong signals over distances of about 500 to 1200 miles on both bands. the e layer effect will show up as very short skip on 20 and 14 mhz.

for the forecast week, some slight rise in the solar flux is expected. this will make 14 and 21 mhz sound better, but major openings are unlikely on 28 mhz. two days of good conditions, as far as absorbtion and selective fading are concerned, were coming to an end as this was being written sunday night. the disturbance will be intermittent through the 16th, and there will be more at the end of the week, but no serious (garble) is expected. the area of the sun responsible for the solar flux of 80 on march 24 will be back late this week. there should be some of its life left on this time around, so the muf will be a bit higher by next weekend.

american sunspot numbers for april 4 to 10 were between 18 and (??) with a mean of 9 ar

Myself and two other hams who are motorcycle riders
have been trying to come up with a reliable way of
communicating with 2 meter hand helds while
riding. Restrictions: We do not use or intend to use
either windscreens or the "full" type helmets, but the more
open 3/4 type helmet with plastic faceshield.

We have tried the following:

Originally used Maxon FM two way radios modified to
fit the helmets. These operated on the 49 mhz channels,
and use a boom type electret mike element. Voice quality
very good; VOX not used.

Problems: The range of these radios reached up to
1/2 mile, but only when under ideal, ie, engines off,
conditions. With the engines on and riding on the road,
range was at best aprox. 500 feet,due to ignition noise -
difficult to eliminate. Also, wind and engine noise
reduced intelligability as road speed increased.

Next, we tried 2 meter HT's , reasoning that the higher
power would also increase the range. Electret boom
 mikes were also used again.

Problems: Only one boom mike setup was specifically designed
for the HT it was used on(IC-02AT Headset). The others were a
boom from the Maxon radio and a Radio Shack type mike.
The audio was very bad on these other units as driving speed
was increased; the previous Maxon setup had much better
voice quality. The problem seems to be in the type
of biasing and interfacing of these other mikes.
The range was increased, but speach intelligability was

much worse than the Maxon. Also, wind noise was still
a problem in the one HT which worked the best.

There are various commercial radios specifically for
motorcycle use, mostly variations on the Maxon radio
with microphones meant to be mounted inside a "full"
type helmet. I am aware of a microphone/speaker system
manufactured by Honda Motorcycle which consists of what
appears to be some type of noise cancelling mike for
faceshield mounting, meant to be used with a CB radio
mounted on their bikes. I do not know if this has
been successfully used for Ham radio applications.

We have had many suggestions ranging from using aircraft
style throat mikes to wearing full helmets and using
windscreens all the time. As stated earlier, we do
not like either the full helmet or windscreens.
The mike element will be exposed to the airstream and
road noise, so would have to be some kind of super
noise cancelling type.

I would welcome mail from anyone who has actually solved
this problem or is in the process of experimenting with it.

     73's,

Scanner Manufacturers Pressured to Limit Frequency Coverage

The 406 - 420 MHz band has long been used by federal government agencies for communication of sensitive information. Until recently, this range was not receivable on programmable scanners sold by Electra (Bearcat), Regency, or Radio Shack.

Speaking at an April 20th scanner club meeting in Berkeley, Illinois, an engineer from Electra confirmed

the rumor that it was US government pressure which persuaded scanner manufacturers, eager for timely FCC Part 15 certification, to omit this band from their models.

Tradition was broken in 1982 when Radio Shack imported the 2020 scanner, made by General Research Electronics of Tokyo, which featured coverage down to 410 MHz.
Sales literature for JIL's imported SX200 even went so far as to openly tell customers that they could "Tune Military, FBI, ..., DEA, Defense Department, Justice Department, plus other restricted radio bands no other scanner is programmed to pick up."

Not to be outdone by the imports, Electra introduced its American made Bearcat 200 with coverage to 406 MHz.
Regency, whose American scanners were spec'd down to only 440 MHz, made service manuals available which revealed coverage below 440 MHz was possible on all its programmables by simply striking the "." key before entering the frequency digits.

Today, government agencies are using digital voice scrambling and spread spectrum techniques to ensure privacy of sensitive communications. Feeling less government pressure to limit coverage, and increasing consumer demand for more coverage, scanner manufacturers are introducing models whose spectrum is limited only by technology and price. The Regency MX7000, with
25 - 550 and 800 - 1300 MHz coverage is but one example.

How easy would it be to modify the code in a modern PLL HT to enable tuning
out-of-band? It would be nice to have some additional receive range without
those kludgey band shifter antenna bolt-ons. I would think you can tell the
PLL to do whatever you want, you just have to get the software to believe this.

I am looking for a copy of the latest Radio Moscow SW Schedules for
the World Service (English) and English to East and West North America.

The latest skeds are for the March-May time frame with another set
comming out June-Oct.

If anyone has them, please send me a copy c/o my home address in
the ham callbook (N1BFF) or c/o my work address.

Thanks

News Flash - Tucson, Az.

The Tucson Amateur Packet Radio Corporation (TAPR) announces the greatest sale in Packet Radio History! The same TAPR TNC kit that has previously sold for $240.00 is now available in limited quantities for $160.00 !!

That's right, $160.00.

Now that outside production of the TNC is assured, we can move on to other things. TAPR is shutting down the production line on this product, and wants to clear out its parts inventory. Recent reductions of our costs, volume buying, our success in turning production over to regular industry, and the desire to clear the decks makes it possible to offer the same high quality kit at this rock bottom price. We'd like you to help us get clear of the manufacturing aspects of this product as soon possible, which is why we're making these available at a give-away cost.

Our software and other support activities for the TAPR TNC will continue unabated.

Quantities are extremely limited, so call the TAPR office immediately at (602) 746-1166 to get your order in.

TAPR is an R&D oriented organization. Our goal is to prove the packet concept and convince mainstream manufacturing organizations to produce packet equipment. Now that AEA is producing an assembled version of our design, Heath is producing an exact duplicate of our kit at high volume prices, and Kantronics is producing a unit running our software, we feel it's time to move on and push out the edges of technology again.

We're sure you can't find a comparable packet controller at this incomparable price. If you've been sitting on the fence, now is the time to join the packet radio revolution!

TAPR will have a major presence at the Dayton Hamvention again this year, with participation in several technical forums. Many of the volunteers serving as TAPR's R&D staff will be present at our booth, and we'll have lots to talk about. Be sure to stop by and help chart the future.

PS, there are less than 95 cabinets for the kit TNC left.

NO MORE WILL BE MADE!

So, if you've been waiting to order one, now is the time. There will be no reduction in the $70.00 price on this item, since our cost already exceeds your cost.

Any TNC orders processed on or after 22 April 1985 will be shipped at the new price. A shipping and handling charge of $10.00 will be added, as will the 3% credit card service charge if plastic is used. At a total cost of $175.10, delivered, you won't find a better deal anywhere!

To: All Amateur Radio Stations

Announcing the KY2D Packet Radio Gateway!

The KY2D Packet Radio Gateway is a 68000 based UNIX** System operated by Jim Kutsch, KY2D, from Little Silver, New Jersey and serves as a gateway for amateur packet radio to "Usenet-netnews" and the "UUCP" computer mail network. Packet radio stations in the greater New York City area can read and post netnews articles in the "net.ham-radio" newsgroup. A local group called "general" is also available for items of interest only to users of the KY2D system. Additionally, electronic mail can be exchanged both between packet users as well as with the Usenet community.

For those not reading this on netnews, Usenet is a world-wide collection of computers sharing news articles. The articles, themselves, are called the "netnews". Many large corporations and universities have systems connected to Usenet. There are over 12,000 sites on Usenet, most in the continental US, but Hawaii, Korea, Japan, and many sites in Europe are also connected. For more details, see the article "Usenet: A Bulletin Board for UNIX Users," by Sandra L. Emerson, Byte, Oct. 1983, pp. 219-236.

If you are a packet user in Northern NJ, New York, or southern CT, try connecting to "ky2d-2" on 145.01. When you get the "login:" prompt, reply with "guest". Some preliminary instructions will be provided after login. Frequent users can request a personal login.

For more info, contact Jim Kutsch, KY2D, via the callbook address or mail to ...!ihnp4!houxn!hou5h!ky2d!jak or ...!ihnp4!houxn!jak

The MIT Radio Society and UHF Repeater Association will conduct a volunteer exam session for all classes of amateur license. The session will take place on Thursday, May 16 at 7:00 pm. Address: 77 Massachusetts Avenue, Cambridge, MA. Please bring with you to the exam: a completed FCC form 610 (available from the FCC), the $4.00 exam fee in cash, and a copy of any amateur license you currently hold. Also required will be two forms of identification. Please contact Craig Rodgers, WA4C at either (617) 225-6616 or (617) 494-8637 no later than Tuesday, May 14 if you are planning to attend. A limited number of walk-in candidates will be accepted, space permitting. This is a W5YI-VEC session. via WA2EYC

C2970 CC123 JEFF WARD (ARRL,2977)   4/23/85   4:56 PM L:285
KEYS:/RM-4879/FCC/AUTOMATIC CONTROL/

BEFORE THE
FEDERAL COMMUNICATIONS COMMISSION
Washington, D.C. 20554

In the Matter of

Amendment of Part 97 of the Commission's Rule to Permit automatic control of amateur radio stations	PR Docket No. 85-105 RM-4879

NOTICE OF PROPOSED RULE MAKING

Adopted: April 5, 1985 Releasted: April 11, 1985

By the Commission:

1. Notice of proposed Rule Making in the above-captioned matter is hereby given.

2. The Commission has received a petition (RM-4879) from the Americal Radio Relay League, Inc., (ARRL) seeking to amend the Amateur Radio Service Rules to permit automatic control of digital communications on all amateur frequencies above 30 MHz.1/ The ARRL notes that Part 97 currently contains provisions for automatic control of stations in repearter, auxiliary and beacon operation but makes no provision for automatic control of routine digital communications. In support of it's petition, the ARRL states that a variety of digital codes, such as rediotelepriner, transfer of computer programs, direct computer-to-computer communications and "packet switching" systems lend themselves to a mode of amateur radio transmission where a control operator need not be present. According to the ARRL, present

microprocessor and computer technology now routinely present at amateur stations can automatically transmit and receive digital communications, verify receipt of messages and respond to inquiries. The ARRL notes that the use of the Computer Based Message Systems (CBMS) are something new in amateur communications and should be encourage by more experimentation, including automatic control which is both feasible and necessary to facilitate further development in the art of amateur radio. Two timely comments were filed. Both supported the petition for rule making.

3. Automatic control in the Amateur Radio Service has previously been approved for repeater, auxiliary links and beacon operations. 2/ With an ever-growing list of amateur operations where automatic control is permitted, we believe that now may be the appropriate time to expand automatic control to all amateur operations, prohibiting its use only in those situations where there is a justifiable reason why automatic control should not be allowed. Therefore, we invite amateur radio operators in general, and amateurs experienced in automatic control in particular, to submit comments calling to our attention any problems that may arise by expanding automatic control to encompass all amateur radio operations. Our goal is to keep the amateur service abreast of technological developments and to utilize new technology, such as CBMS, where appropriate. On the other hand, we do not want to introduce any innovations into the service which would be disruptive of amateur communications or which would essentially change the character of the service.

4. We propose that any amateur radio station may be under automatic control, except when transmitting on frequencies below 29.5 MHz. As noted earlier, the petitioner did not request automatic control below 30 MHz. However, since automatic control is already permitted for repeater operation between 29.5-29.7 MHz, it is reasonable to make the lower limit for automatic control 29.5 MHz, rather than 30 MHz.

5. These proposed rule amendments would still prohibit automatic control operations in any instance where the station is transmitting third-party traffic. This is in accord with Section 97.79 (d) of the amateur rules which specifies that a control operator must always be present when a third party is participating in amateur radio communications. 3/

6. For purposes of this non-restricted notice and comment rule making proceeding, members of the public are advised that ex parte contacts are permitted from the time the Commission adopts a Notice of Proposed Rule Mking until the time a public notice is issued stating that a substantive disposition of the matter is to be considered at a forthcoming meeting. In general, an ex parte presentation is any written or oral communication (other than formal written comments/pleadings and formal oral arguments) between a person outside the Commission and a Commissioner or a

member of the Commission's staff which addresses the merits of the proceeding. Any person who submits a written ex parte presentattion must serve a copy of that presentation on the Commission's Secretary for inclusion in the public file. Any person who makes an oral ex parte presentation, addressing matters not fully covered in any previously-files comments in the proceeding, must prepare a written summary of that presentation; on the day of the oral presentation, that written summary of that must be served on the Commission's Secretary for inclusion in the public file, with a copy to the Commission official receiving the oral presentation. Each ex parte representation must also state by docket number the proceeding to which it relates. A summary of the Commitssion's procedures governing ex parte contacts in informal rule makings is available from the Commission's Consumer Assistance Office, FCC, Washington, D.C. 20554, (202) 632-7000.

7. Authority for issuance of this Notice is contained in Sections 49(i) and (303)(g) and (r) of the Communications Act of 1934, as amended, 47 U.S.C. 154(i) and (303)(g) and (r). Pursuant to the applicable procedures set forth in Section 1.415, 47 CFR 1.415, of the Commission's Rules, interested persons may file comments on or before June 25, 1985, and reply comments on or before July 25, 1985. All relevant and timely comments will be considered by the Commission before final action is taken in this proceeding. In reaching its decision, the Commission may take into consideration information and ideas not contained in the comments, provided that such information or a writing indicating the nature and source of such information is placed in the public file, and provided further that the fact of the Commission's reliance on such information is noted in the Report and Order.

8. In accordance with Section 1.419 of the Commision's Rules, 47 CFR 1.419, formal participants must file an original and five copies of their comments and other materials. Participants who wish each Commissioner to have a personal copy of their comments should file an original and eleven copies. Members of the general public who wish to express their interest by participating informally may do so by submitting one copy. All comments are given the same consideration, regardless of the number of copies submitted. Each set of comments must state on its face the proceeding to which it relates (PR Docket Number) and should be submitted to: The Secretary, Federal Communications Commission, Washington, D.C. 20554. All documents will be available for public inspection during regular business hours in the Commission's Public Reference Room at its headquarters in Washington, D.C.

9. In accordance with Section 605 of the Regulatory Flexibility Act of 1980 (5 U.S.C. 605), the Commission certifies that these rules would not, if promulgated, have a significant economic impact on a substantial number of small entities because these entities may not use the Amateur Radio Service for

commercial radiocommunication (see 47 CFR 97.3 (b)). In addition, the proposed rules concerning expansion of the automatic control in the Amateur Radio Service would not significantly impact on the manufacturers of amateur radio equipment since devices installed to secure the radio equipment from unauthorized use or to detect transmitter malfunction are not usually purchased from such manufacturers.

10. In view of the foregoing, rule making petition RM-4879 filed by the ARRL IS GRANTED.

11. IT IS ORDERED, That the Secretary shall cause a copy of this Notice to be served upon the Chief Counsel for Advocacy of the Small Business Administration and the Secretary shall also cause a copy of this Notice to be published in the Federal Register.

12. For information concerning this proceeding, contact Maurice J. DePont, Federal Communications Commission, Private Radio Bureau, Washington, D.C. 20554 (202) 632-4964.

FEDERAL COMMUNICATIONS COMMISION

William J. Tricarico
Secretary

Attachment: Appendix

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulations would be amended, as follows:

1. Section 97.3 (m) (3) would be amended to read:

97.3 Definitions

* * * * *

(m) * * *

(1) * * *

(2) * * *

(3) Automatic Control means the use of devices and procedures for control of an amateur station without the control operator being present at the control point.

1. Section 97.79 (b) would be amended to read:

97.79 Control operator requirements.

* * * * *

(b) Every amateur radio station, when transmitting, must have a control operator. The control operator must be present at the control point of the station, except when the station is transmitting under automatic control. The control operator must be a licensed amateur radio operator or permittee designated by the station licensee. The control operator and the station licensee are both responsible for the proper operation of the station. For purposes of enforcement of the rules of this part, the FCC will presume that the station licensee is the control operator of the station, unless documentation exists to the contrary.

3. A new section 97.80 would be added, as follows:

97.80 Operation under automatic control.

(a) An amateur radio station may be operated under automatic control:

(1) When in beacon operation on frequencies 28.20-28.30 MHz; and

(2) When transmitting on frequencies above 29.5 MHz, except when in beacon operation on:

(b) When under automatic control, devices must be installed and procedures must be implemented which will ensure compliance with the rules when the control operator is not present at the control point of the station.

(c) No amateur radio station may be operated under automatic control while transmitting third-party traffic.

(d) Automatic control of a station must cease upon notification by the Engineer-in-Charge of a Commission field office that the station is transmitting improperly or causing harmful interference to other stations. Automatic operation must not be resumed without prior approval of the Engineer-in-Charge.

4. Section 97.85 (e) would be deleted. Paragraphs (f), (g) and (h) would be redesignated as paragraphs (e), (f) and (g), respectively.

5. Section 97.86 (a) would be deleted. Paragraphs (b), (c) and (d) would be redesignated as paragraphs (a), (b) and (c), respectively.

6. Section 97.87 (b) and (c) would be deleted. Paragraph (d) would be redesignated as paragraph (b) and paragraph (e) would be redesignated as paragraph (c). In redesignated paragraph (b), the last sentence would be amended to read: "In such cases, the rules of 97.85 (e) (1) (2) and (3) apply." A new paragraph (d) would be added to Section 97.87 to read, as follows:

(d) Beacons under automatic control transmitting below 432.08 MHz are restricted to the following emissions: NON, A1A, F1B and J2A.

7. Section 97.114 would be amended by adding a new paragraph (d) as follows:

97.114 Limitations on third-party traffic.

* * * * *

(d) Third-party traffic from any amateur radio station under automatic control.

FOOTNOTES

1. The ARRL said that it was not requesting automatic control for frequencies below 30 MHz (HF frequencies) because heavy frequency usage below 30 MHz made manual control of digital communications on those frequencies more appropriate.

2. For automatic control of stations in repeater and auxiliary operation, see Report and Order in Docket No. 20012, adopted June 11, 1975; FCC 75-706; 40 FR 26524, June 24, 1975. For automatic control of beacon operations, see Report and Order in PR Docket No. 81-823, adopted October 21, 1982; FCC 82-455; 47 FR 50702, November 9, 1982.

3. See also News Release, Report No. 2028, Mimeo No. 8832, October 25, 1978.

C2970 CC124 JEFF WARD (ARRL,2977) 4/23/85 4:58 PM L:24
KEYS:/RM-4879/AUTOMATIC CONTROL/ARRL/

Subject: PR Docket No. 85-105, RM-4879

Some concern has been expressed about the above docket which is to permit automatic control, particularly the wording that would prohibit automatic control when transmitting third-party traffic. We have been asked how to interpret this as well as what the Commission intended by these words. Offering an opinion at this time would not be productive. It would be better for you to take the wording at face value and react to the FCC accordingly. If you plan to comment to the FCC on this docket, please let us know

if you need any information on preparing comments. Also, when
you file comments with the FCC, please send a copy to the ARRL.

Another question has been "When will the ARRL act on this?" The
usual procedure is for the ARRL Executive Committee to determine
the policy position, then the Hq staff and legal counsel in
Washington prepare the specific wording of the comments. The next
meeting of the Executive Committee will be May 18, in Rochester.
So, if you wish to have the Executive Committee hear your point
of view, your comments should reach ARRL Hq (Attn: Dave Sumner) a
few days before the 18th.

qst de k9eui
hr propagation forecast bulletin nr 16 from arrl headquarters
newington ct   april 21, 1985
to all radio amateurs bt

the area of the sun responsible for the march solar flux peak
of 80 is back with us again. the flux had been down to its
cycle 21 low of 69 on april 16, but was back up to 72 on the
20th.   a sizable spot group about 3 days in from the east limb
of the sun showed marked eruptive activity intermittently on
saturday and continuously through sunday afternoon. the solar
flux jumped five points to 77 on the 21st, as propagation went
from bad to worse until it began to stabilize again late that
day. with the wwv k index peaking at an almost unheard of 8,
reception   of   their   propagation   bulletins was all but
impossible, for the first time in our 7 years of part time
florida living.

such near or total blackouts in the 5 to 20 mhz range are likely when the solar flux rises suddenly. more communications difficulty is likely when charged particles from the eruptions enter the earths atmosphere, some 18 to 36 hours after the event itself. this is likely to bring auroral conditions in the higher latitudes on monday or tuesday, and generally poorer propagation on all but transequatorial circuits. there may even be an enhancement on north south paths on 50 and 28 mhz at such times. if we are to have any good te work on 50 mhz this spring it should come this week.

there is ordinarily a period of exceptional propagation on all dx frequencies, as a major disturbance clears up. no accurate prediction can be made for this event. the best indication is a drop in the wwv k index, given as part of their bulletin transmitted at 18 minutes past each hour. a downward trend is the thing to watch for, particularly when the k index gets down to 2 or lower.

the period april 28 to may 2 is likely to bring at least one medium level disturbance. this could be followed by our first sporadic e skip of the season, on 50 mhz ar

According to a friend who spoke with TAPR at 3pm PST yesterday, they had 50
(fifty) TNC kits left at the $160.00 price. They had sold 120 units up to
that point yesterday.

The Realistic DX400 (brother of the Uniden CR-2021) is on sale according

to a 64th Aniversary Sale Flyer from Radio Shack for $179.95. The regular price is $299.95. The sale ends May 20, 1985.

These are portable synthesized digital readout receivers covering 150 khz to 30 MHZ continuously AM/SSB/CW and 87.4-108 MHZ FM. Last year they were "dropped" from the Uniden product line and sold on closeout (as the Uniden CR-2021) for around $100. However Radio Shack kept their prce at $299.95.

I was fortunate to pick up a Undien CR-2021 and am quite impressed, for the money it works great as a take-along portable.

I think the $179.95 price for the DX400 is within reasonable limits (I still feel $299.95 was outrageous) for this type of receiver. So for those of you who missed to Uniden CR-2021, here is another chance.

I needed to set up a temporary CB base station in an office on the 6th floor of a building, so remembering that my 2M HT uses a 1/4 wave vertical antenna which doesn't require any loading or tuning, I ran some RG58 coax from the CB tranceiver over to the window, grounded the coax braid to the radiator (heat radiator, that is; not RF), and soldered the center conductor to a 1/4 wavelength long piece of wire which was dropped out the window with a rock tied to the other end.

It works better than the mobile magmount that we'd been using on top of the desk but not much, and seems to have a lousy SWR.

Can anyone suggest a better way to make a wire antenna? Did I cut
the wire to the wrong length? We have no test equipment to speak
of, cannot nail things to the side of the building or bring stuff
up to the roof, etc. etc.

Please reply by mail, not to the net. If interest warrants I'll
post a summary. Thanks much!

     Paul Rubin (WA2QYN/6 but that license exam was sooo long ago...)

I went out and did just that. However, I find a peculiar type of
interference that is local to my apartment building , and was wondering
if somebody out there could help me find a way to find it. The
interference appears as a pulsing sound, approximately one cycle per
second, covers a wide range of frequencies (from about 5MHz to 15MHz),
and does not go away at any time of day. I turned off all power to my

apartment with the circuit breakers, and yet the signal persists,
indicating a neighbor is at fault. I also brought the unit to a remote
area to see that it was not the radio itself.

Can somebody give me a reasonable way to find the neighbor that is causing the
interference? Should I bring the FCC in if I can't resolve the problem?

Keywords: IC22S

I've just picked up a used ICOM IC-22S 2m rig at the Dayton Hamvention (it
was good this year too) for use in my packet radio station. The packet
activity here is on 145.01 MHz. Here are the two problems:

    1 - the rig is only specifie to operate from 146 to 148 MHz. Will
        it work below 146? If not, what do I have to do to make it
        work?

    2 - the 145.01 frequency does not fall on its 15kHz channel
        spaceing. I assume that I can diddle the VCO reference
        oscilator to correct this. Note that I'm not interested in
        operating this rig on any other frequencies. At least not
        now.

Just to jog your memory, the IC-22S is the 22 channel diode progammable
mobile rig that ICOM marketed about 4 or 5 years ago. About 10 watts,
146-148MHz on 15KHz channels.

I bought one of the TAPR ``fire-sale'' TNC kits, and one of the cabinets
during this sale. But I'm not happy.

Let me explain: I own one of the original TAPR Beta-test boards, and I
like it. I had been planning to buy another TNC for some time, and was
just waiting until my finances would permit me to do so without some
strain. Then TAPR announced that they would no longer be producing the
TNC, and were selling off the remaining stock at a lower price.

So, to make sure that I had one, I bought one. It was really nice to
get it at a lower price, but it was the pressure to get one before they
were all gone that moved me to buy it.

Sure, I could have bought the same thing from Heathkit, or AEA, or GLB,
or one of the other manufacturers now making TNCs, but out of some sort
of loyalty to TAPR (after all, they were the ones who went out on a limb
to develop these wonderful things!), I bought a TAPR one. That was
Tuesday.

Saturday morning, I find out that TAPR is not going out of the TNC
business. What they ARE doing is introducing a new nice little TNC that
should be on the market in a while (I'd guess 3 months or so, but what
do I know?), and were dumping the older TNCs so they could get started
on the new ones. Not a word of this in the advertisement - just a sort
of veiled hint that they were going to move on to ``other things''.

Now understand: I'm not pissed that they are coming out with a new TNC, nor with the fact that I bought one of the older kits. I think I'd rather have the kit that's been on the market for a while, rather than buy a new unit that isn't debugged yet (look, NOTHING is fully debugged until its been out a while - and six months frequently isn't long enough for some things I've seen. TAPR does amazingly well in this regard).

No, what annoys me is the feeling of having been used. I resent the ``cleverly worded'' message, and the feeling that I this was my last chance to buy a TNC from TAPR. Perhaps its my imagination, but I somehow see some people at TAPR smirking at how clever they were.

I'm still glad I bought the TNC. I'll put it to use as soon as it gets here. I know its a good product, and will work well for me.

But I don't trust TAPR anymore. I can no longer think of them as fellow hams, trying to advance the state of art on a shoestring. No, now I have to regard them as just another bunch of ``clever'' businessmen. And that makes me sad.

I don't think I'll buy my next TNC from TAPR, no matter how nice it may be. Somehow I feel betrayed, and ``once burned is twice shy''.

I want to thank everyone who sent me mail (good and bad) about the
Radio Moscow skeds. I received the World Service and North American
skeds in the mail a few days ago from the station.

The reason I needed these are to coordinate Radio Moscow transmitter
sites for DXing. Radio Moscow transmits from about 100 sites all
over the Soviet Union. Yes I know they are everywhere (especially
40 meters, they own the band). I am trying to receive Asian sites
such as Yuzhno-Sakhalinsk and European sites such as Leningrad. Its
not that I need to hear them on any frequency, the skeds just coordinate
the information I have to narrow down the sites.

Why ? Just a crazy way of DXing I guess, as I am trying to verify 50
Radio Moscow sites. By the way I'm also now working on DXing a Soviet
Ham in each Soviet Republic. Hopefully when I upgrade my license and
get a station set up, a few QSO's will be possible.

Thanks for the help guys, the response has been great.

Jeff, as you pointed out, this interference isn't within the DX400. I doubt if it's any neighbor either. It sounds to me like interference from Cable TV. There are some special signals on many cable systems that have a 1 second pulse of some kind (you can hear it at the top of the FM band and on some unused cable channels). A good outdoor antenna should solve the problem. If not, get your cable TV people to check for leakage.

Actually, I don't feel upset about it at all. I bought one of the fire sale kits as well (although it hasn't arrived yet).

Personally, I'd MUCH rather have the kit version of the old reliable board at a good price (which is probably lower than what the new one will be, I bet). Their note said exactly what they meant, that they were not going to be producing the old one, and wanted to clear stock for other things. Considering their past history of being heavily involved with packet, I ASSUMED that the other things would include packet equipment...

What they did was convey a large amount of useful material to a large group of hams at what probably amounts to cost or only a little more. My high opinion of TAPR stands. They're not out to rip anyone off, they just don't want to get stuck with a lot of parts when everyone starts buying Heathkit TNC or some such.

I ordered a Heath TNC as soon as the catalog came out and it was an

"official" product. Recieved my kit Thurs the 25th. (i picked mine up at my local store)

The kit is nice. Uses a taped roll of resistors, diodes and caps to speed assembly. I took about six hours to glue the thing together and make cables for my terminal and radio. The kit comes with a connector and cable for the connection to the radio but none for the terminal.

I had some bad parts - most were locally replaceable. The first was a bad 7912 -12V regulator that liked 18 volts better than 12 . The second was a
MC1458 op amp in the output to my transmitter. This was pretty easy to find as the last step in calibration (audio level and tone null) would not work right. the idea of this cal step was to hook a scope onto the audio output and adjust the level with ptt on. then turn off ptt and adjust a null control for minimum level. then set the proper audio level key down to make sure. Well my op-amp was a better oscilator than amplifier so no matter how i adjusted things, the level stayed the same. Being curious, i looked at the input of the op-amp and saw evrything o.k. so i swapped the chip and viola ! i am on the air.

My last problem regards the Non - volatle ram. I can not seem to program it. I will consult heath and probably get a new chip or some such.

anyway... i have had a contact with the thing... seems to work although i need a better antenna and more power (i am running a whopping 3 W) I can hear a lot of stations that can not hear me.

Heath did provide good instructions for hooking the unit to various radios including my ICOM IC02AT which required a transformer on the XMIT side of things.

All in all i am happy and satisfied with what i got.

My father has purchased a TS520 and wants a Digital Display
to use with it. If you have one for sale, know where there is
one for sale or know where I can get a manual for the display,
please respond by email or phone.

Thanks.

I called TAPR yesterday 4/29/85 at about noon and all of the
sale boards are gone. However there are about 200 manuals which
will probably be cleap to get. ($10.00?) The person I talked to
said that they are planing to sell a new kit which has more features
for approximatly the same price soon.

At least you got your TAPR TNC at a discounted price. I ordered on many
moons ago, waited for about 6 or 7 weeks, saw the announcement of the
new, reduced price and then received the one that I ordered at full price
a few days later. I could have canceled and reordered and saved about $100.
Oh well...

Out of Band Coverage for 2 Meter Portables

> How easy would it be to modify the code in a modern PLL HT to enable tuning
> out-of-band? It would be nice to have some additional receive range without

> those kludgey band shifter antenna bolt-ons. I would think you can tell the
> PLL to do whatever you want, you just have to get the software to believe
> this.

Changing the firmware in a 2m ht is not for the faint
of heart.

The older ICOM IC2's range may be extended to 140 - 150
MHz by cutting and soldering, no new components needed.
73 magazine detailed two ways to extend the coverage on
the older Kenwood TR2400. One method used the injec-
tion signal from the transmit PLL on receive, although
the frequency display wouldn't track the true receive
frequency. This resembles the old trick of placing the
receive crystals into the transmit crystal sockets of
older crystal controlled CB radios so they could
transmit on 10 meters.

Nowadays, 2 meter portables are used for non
ham
activities, particularly for warfare in the Middle East
and Central America. Not wanting to miss a major
market segment, Japanese manufacturers have started
adding additional frequency coverage capabilities into
their 2m rigs.

The ICOM IC02AT's coverage can be modified by the addi-
tion of a few diodes. The Kenwood TR2600A already
cov-
ers 140 - 160 MHz on receive right out of the box
and
can transmit the same wide range by cutting a two com-
ponent leads.

I have recently learned that the UPI is using spread spectrum transmissions from one of the Westar or Galaxy satellites to feed news to small earth stations (2-3 feet in diameter).

I understand that the technology used was developed by a company called Equatorial Communications. I further undertand that the spreading is done by diphase modulating a carrier with a pseudo random sequence at a much greater rate than the actual data stream being transmitted so as to convert it into a 2-mhz wide noise like signal which is uplinked to occupy part of the bandwidth (and power) of some transponder.

It seems to me that it might be a challenging and fun task (with the understanding of course that the recovered data would not be used for other than my incidental amusement and definately not for benefit or gain) to demodulate the signal and recover the news. In order to do this I need some more details of how the system works. Specifically :

1. Which transponder of which bird carries the UPI feed ? What is the exact carrier frequency of the signal ? How powerful is it ?

2. What is the chip rate (PRN sequence bit rate) used ?

3. What is the actual data bit rate (IE how many chips to a bit) ?

4. What is the PRN sequence used ? How is synchronism with the local correlator sequence generator obtained ? I have been told that there is some sort of reset pattern, is this true ? Is the sequence ROM based or generated by a feedback shift register circuit ? If I recover the chip sequence with a large enough dish and a PSK demod could I figure out how to generate it (given that some parts of the sequence I recovered were inverted by data) ? Does anybody know a good method of figuring out the generating polynomial for a P/N sequence given a sample of that sequence EXOR'd with random data ?

4. Does the data modulate the sequence by simply EXORing with it or does it select entirely different patterns (one pattern for a 1 a different one entirely for a zero). (The later scheme

seems slightly unusual to say the least but some literature
on the system described it that way.) Is NRZI coding used
for the data or straight NRZ ?

5. Am I correct in assuming that the underlying data is sent
in a bit synchronous format (with fixed length characters)
with synchronism established by some mechanism similar to
that used in BSC protocols (a SYN character) ? That information
is packetized with headers and some sort of CRC (a fire code ?)
that can be used to correct errors in the data (same sort of
thing that a disk controller does when it gets an ECC error).
(The company advertises forward error correction, but they
don't say what rate or mechanism is used).

6. Is the actual data (the news) encrypted in any way or should
I expect to see sequences of characters (once I acquire character
framing) that seem to resemble ASCII or Baudot or TTS news stories?
If the data is lightly encrypted could I break the cipher
given lots of plaintext in the form of stories from the same
wires acquired from other sources (such as SCPC carriers) ?
[I might say I very much doubt I would have the time or talent to
to break such a cipher, but I can always hope to find
someone who likes such challenges to help me]

7. Is there a publiclly available filing with the FCC or
any other public record description of the details of
the modulation and coding scheme used ? (I am told that
most such things - even TV scrambling schemes - are available
as public documents if you know where to look)

8. Does anybody know of any features of the system that would
make it impractical for a hacker who is a hardware/software
design engineer by trade to receive news with reasonable
effort ? I assume that one can cheat by using a somewhat bigger
dish and better LNA (there are some 60 K ones now) and not
do quite as optimal a correlator. I assume also that determining
all the details of the packet protocol is something one can do
over time (and only to the extent that one needs to to recover
the "wires" one is interested in). The real idea is to
see a 3 foot dish pointed out the picture window receive
some mostly intelligable news when connected to a breadboard
   full of cicuitry one designed and built controlled by a program
one wrote.

Any help would be greatly appreciated.

Due to an anomaly in the mail system at CRDS (and the fact I had superuser on) my posting requesting information on UPI spread spectrum signals on satellites wasn't properly signed.

What follows is my address ...

> Amateur ops that have been the ONLY communications links
> in local disasters (and we get our share!)-

Gosh, did the police, fire, ambulance, power company, and phone company
radio systems all go out at once? Did the REACT people all hide? Or
(more likely) were the hams so "full of themselves" that they didn't
notice that almost everyone was communicating fine without their help?

>   YOU'RE FULL OF IT!

My apologies if I offended you. Unfortunately, it is indeed the few hams who *are* still involved in public service that would be offended. But even then, only if they refuse to acknowledge the reality -- that the times have changed, that hams have abandoned public service activity, and that other services have stepped in. These services can do a better job (because of sheer number of units) than hams could ever hope to do.

I speak from the position of one who spent many years in ham radio public service, including a few years as regular NCS on WESCARS, and many years regular participation in NTS, including PAN NCS and a brief stint on TCC (including an all-nighter during a major East-coast disaster).

I mourn the passing of an era, one that gave me considerable enjoyment and fulfillment. But I cannot deny its passing.   de n7fb

Re: the squeaky "wheels" (Honder Accawhd -- I'm from Bahstun).

In my experience, black "electrical tape" is not good for long term
installations as it tends to dry out and come loose after several years of
heat, humidity etc.

I have had much better luck with "ducting tape" which is available from most
hardware stores. The only time I have seen it fall apart is when exposed to
direct sunlight for a couple of years (as on an antenna).

Who, me?

I will be happy to try to answer the question, although I didn't think I had
anything to do with it except maybe to make a wise comment or two...

"   I keep feeling that this is something that I should understand-- at least qualitatively-- but I don't!

     I assume that one receiver is acting as a converter for the other. Please enlighten!

     I wonder if something similar cfeeling that this is something that I should understand-- at
least qualitatively-- but I don't!

     I assume that one receiver is acting as a converter for the other. Please enlighten!

     I wonder if something similar could be done to use an F.M. receiver to receive the cordless telephones in the range 1.6 to 1.8 mhz.?

          TNX!

               Jim (W2OZH) "

As I recall, the setup described by Bob Parnass (I think that was who it was) was to hook a VLF receiver to the output of an ordinary FM receiver to pick up SCCA (sic - I always call it that, Sports Car Club of America, when it should really be SCA - Subsidiary Communications Authorization or something!) transmissions multiplexed on ordinary FM broadcasts.

To understand what is going on, you need to know what the FM station actually transmits.

Let's do it in "top down" fashion. All you computer jocks out there should relate nicely to that.

First of all, the FM station has a "composite audio" input - this is just the input on which SOMETHING (consider it a stub subroutine to be written later) is fed in to the modulator.

>From the FM modulator's point of view, what you put on this input is just the MODULATING SIGNAL which you want to Frequency Modulate (FM) the station's carrier. Intuitively, you can think of the station as putting out a "pure" carrier at frequency F when this modulating signal is zero. When it is NONZERO, however, the instantaneous frequency of the transmitter is changed. Say the modulating signal value, in volts, or whatever, is M. Then the transmitter output frequency is set to F + K*M, where K is a sensitivity constant which is unimportant except that whatever maximum value of M is applied to the FM modulator input should result in a maximum "frequency deviation" K*M which is just about the maximum that the FCC allows.

If this station were a plain old-fashioned monaural FM station, all you would

have to do is feed in the audio signal -- voice, music or funny sound effects -- which you want the listeners out there in Radio-Landt to hear.

The signal would modulate the carrier, be amplified, fed to the antenna, and radiated. It would come swooping down into your ordinary, Monaural FM receiver. The receiver would say, hmm... The frequency is F + K*M. I therefore have to subtract F and divide by K to give my loyal owner the instantaneous value of the signal waveform, which is M. Voila! Out of the FM demodulator comes M in livid high fidelity.

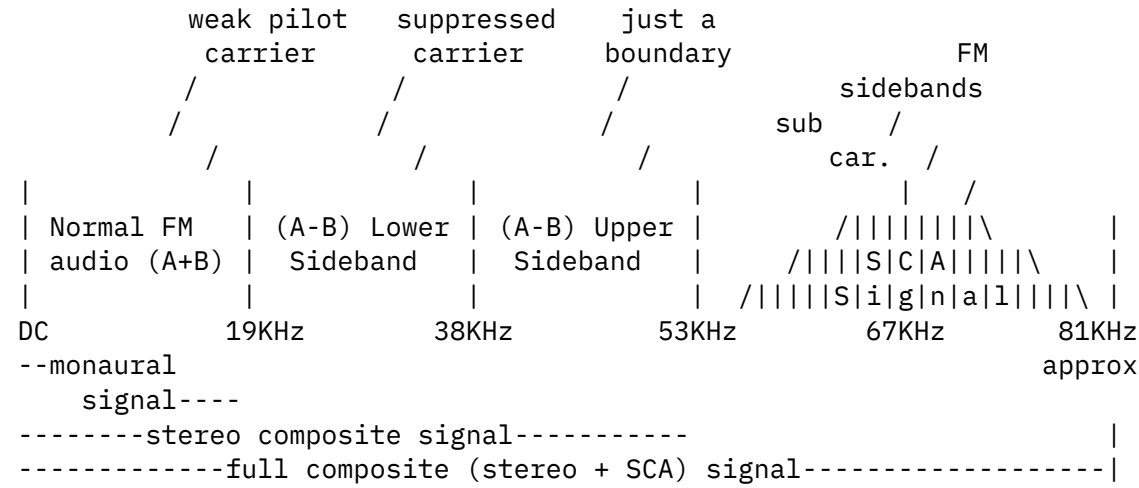
(I don't think the following information is needed for present purposes, but I include it so somebody won't say I am oversimplifying things!!!) Now, even in simple monaural FM there is one trick that we haven't mentioned. This is called pre-emphasis and de-emphasis. Very early in the game, it was noticed that in FM systems if you fed in no modulation at all and listened to the receiver's reconstructed value of M (after it did the arithmetic noted above), there was a NOISE output from the receiver, even at fairly strong signal levels. The noise was particularly noticeable because its amplitude increased with frequency. Thus a quite noticeable high-frequency hiss was present on even fairly good signals. Somebody then had the bright idea that they should effectively "turn down the treble control" at the receiver. A fixed frequency compensating network called a "de-emphasis" network was designed and standardized to do that. But then the music had its highs "de-emphasized", so an "inverse" network called a pre-emphasis network was added at the transmitter.

Next, along came stereo. In order to avoid the wrath of all the owners of monaural FM sets, the FCC in its wisdom decreed that a "compatible" system would be necessary before they would approve FM stereo. The engineers quickly noted that the A+B signal from two microphones gives a passable monaural signal (especially if "one-point" miking is used). So now the problem was how to get A and B out of A+B. Well, as your high school algebra teacher probably taught your, (A+B)+(A-B)=A and (A+B)-(A-B)=B. So all they had to do is send (A-B) in some clever way and the receiver could reconstruct A and B by "matrixing". The method adopted was to "multiplex" this (A-B) signal onto the main carrier by using it to modulate a SUBcarrier located at 38 KHz. Double-Sideband Suppressed Carrier (DSBSC) modulation was chosen. This gave a "lower sideband" extending downward from 38KHz (less 20Hz or so) to 23KHz (because the highs were cut off at 15 KHz.) A "pilot carrier" was put in at 19 KHz which allows the receiver to recover the precise frequency and phase of the 38 KHz carrier so that recovery of the (A-B) signal could proceed. In fact it turns out that this carrier can be used in an even more clever way to recover A and B signals directly from the "composite" signal (A+B plus pilot carrier plus A-B).

Note that all the new junk -- pilot at 19KHz and A-B from 23 to 38 KHz -- are so high in frequency that most people wouldn't hear them, and most older monaural FM sets and loudspeakers won't reproduce them audibly anyway.

Well, as if this wasn't bad enough, then along came the SCCA (I warned you about my warped sense of humor) and asked for authorization to put MUZAK on the air. The obvious thing to do was to put on yet another subcarrier, this time at a frequency far enough above the audio so that it wouldn't

interfere with stereo broadcasting. 67 KHz was chosen as the magic frequency. But this time, FM modulation was chosen. Remember, all of this stuff is being stacked up in frequency above the normal monaural FM broadcast audio in such a way that a normal FM receiver won't be affected (much) by it. So before we even go into the "composite audio" input of our simple FM transmitter, we have a VERY "composite" signal indeed. One might diagram it like this:



Now to the main point. The FM transmitter takes this composite audio signal as input and FM MODULATES its carrier with it. When this is received by an FM receiver, what comes out of the discriminator is this composite signal. In a normal monaural FM receiver, this is fed to the volume control and thence to the audio amplifier stages, where "de-emphasis" is applied as noted above, and finally out to the speaker or headphones.

The de-emphasis circuit tends to reduce the amplitude of the SCA signal since it is at a high frequency (53 to 81 KHz, with carrier at 67 KHz. However, enough gets through that it can still probably be used even at the speaker jack, since it is an FM signal and the absolute amplitude isnt too important. The best way to recover the SCA audio, however, would be to go in to the FM receiver and tap off at the "top" of the volume control -- the hot side where the discriminator signal is brought in. Bring this signal out to a jack which you can install on the set for all such nefarious purposes. In fact, make sure that the de-emphasis network is not installed ahead of this point, although in my experience it usually is not.

Anyway, once you have brought out the full composite signal, the SCA signal is STILL AN FM SIGNAL that needs an FM discriminator to turn it back into normal audio. It happens to have a carrier frequency of 67 KHZ because that is what was used as the carrier at the studio when the composite audio signal was made up.

So if you have a VLF receiver capable of covering 67 KHz, you can feed the composite audio signal into its input, which happens to be the antenna connection. You can then tune it to 67 KHz and switch it to FM mode and

you should get perfect SCA audio out.

If it doesn't have FM demodulation available at this frequency, then you can still use a trick called "slope detection". Tune it above 67 KHz so that the 67 KHz carrier falls on the lower slope if the IF selectivity curve. I.e. the signal has fallen off about halfway from its peak value on the meter. Select AM demodulation, and then tune for the best sound. You should get acceptable recovery of the audio. If there is a bandwidth switch, experiment with it. Probably the widest bandwidth available will work best.

If you don't have a suitable VLF receiver covering 67 KHz, the simple trick with the Phase-Locked Loop device will work just fine. After all, the monaural FM receiver has done most of the work of picking up the weak signal at VHF (88 to 108 MHz) and amplifying it and FM demodulating it so you have the baseband composite signal available to fool around with. What is going on here is that the PLL locks to the 67 KHz signal, but since that is being FM modulated, it has to work a bit to stay locked. The Voltage-Controlled Oscillator has to be pushed above or below 67 KHz, its natural frequency, by applying a control voltage to the VCO input. All of this is done "automatically" by the design of the phase-locking circuitry, but YOU can benefit by all this work it is doing: the control voltage is precisely a measurement of the instantaneous modulation value, M, that YOU want to hear! So you pick it off, amplify it, and listen to MUZAK (yuk) to your heart's content.

>From the above rather long-winded description, you can see that there is a lot of other junk floating around on the composite signal, namely all the stereo stuff below 53 KHz. To make the SCA demodulator work well and be free of interference from the main channel, it would be well to put a little selectivity ahead of the SCA demodulation if you are using the PLL trick. I haven't experimented with this, but I would think a simple high-pass filter to attenuate everything below 53 KHz would do fairly well. Of course with the VLF receiver you have all kinds of selectivity, so there should be no problem.

I hope this helps you understand what is going on with SCA. If you followed all the details, it should be clear that there is no black magic going on, but that once the composite signal has been received, a VLF FM receiver (a rather rare beastie) is logically what is needed to recover the SCA signal. That's why it happens to be possible to string together such a seemingly unlikely pair of receivers and get SCA broadcasts.

In the case of cordless telephones in the 1.8 MHz region, there is no such composite modulation going on. So far as I know, it's just ordinary AM on the base-to-portable link which is at that frequency. So stringing together receivers wouldn't do much for you. It IS possible, however, to MODIFY an ordinary AM broadcast receiver by retuning its local oscillator and RF stages slightly so that they tune higher and cover the cordless telephone frequencies. Just remove some capacitance and diddle the trimmer capacitors... Then if I'm right about its being AM, you should be in business.

Equatorial considers their spread-spectrum encoding details to
be very highly proprietary. They have not been published.
They also currently scramble much of the data and will probably
be scrambling it all (most likely via DES) rather shortly.

I have never done any SCA work, but in my dimmer memories is the idea
that most FM broadcast receivers have an "SCA trap" in or just after
the detector. If you can find and non-destructively disable such a
trap (or perhalps take signal from across it, assuming it's parallel
tuned, or magneticly couple to the L in the tank), then you may have
enough signal for the 565 circuit.

73's -Bill

     Speaking of Equatorial, there is an article in the current
issue of Business Week about the company. Apparently it has been
selling 2-3 foot dishes (receive only) for a couple years now, using
this encoding scheme mentioned. UPI was one of the customers mentioned
in the article. They also have a 4 foot transmit/receive terminal product,
which has somewhat lower bandwith than the conventional satellite uplink
(probably 56Kbps or some such). No specifics were given, but apparently
the receive-only service is quite popular. There is a picture of the
President of the company standing atop a disply of 15 or so of the
small dishes, with a large (15 meter) dish in the background (probably
what Equatorial uses to feed the data onto the transponder for the
receive only system). Really quite neat...

(I wish I could collect the value of this free advertising to the vendor...!)

Rapid System, Inc., 5415 136th Place, Vellevue, WA 98006 is offering a
"Digital Oscilloscope Peripheral" for several popular Personal Computers.

The device boasts 500 KHz bandwidth (2 MHz sampling rate) and sensitivity
down to 100 mV per division (which is 8 pixels vertically). It has FOUR
separate inputs for vertical channels, plus a separate TRIGGER input with
polarity and sensitivity controls. It provides also for internal triggering,
apparently only when looking at a single channel. (Why don't they gate it so
you can look at all four but trigger off only channel A? Oh, well...)

The peripheral sells for $399 for the Commodore and $499 for Apple and IBM
iterfaced models. (What the traffic will bear is the name of the pricing
strategy they used, I guess!)

So far, so good. However, they ALSO offer a nifty software package
called a Spectrum Analyzer! So if you are too dumb or lazy, or both, to
write your own, you can have not only a 'scope but also an audio (500 KHz)
spectrum analyzer for around $600 if you already have the computer and the
display. (The spectrum analyzer package sells for $149.)

It's not exactly realtime -- they quote 15 minutes worst case to do a
spectrum plot, including data collection, FFT and plotting -- but it sure
is cheap compared to Hewlett Packard!

Rapid Systems evidently isn't big on phone numbers. Possibly they don't have
a phone in the garage. Anyway, it looks like a very nice product for either
hobbyists or low-budget industrial labs who need a not very wideband but
VERY cheap scope and spectrum analyzer.

If anybody has used the system or has bought one, a "road test report" would be very much of interest to the Net.

Congrats to Rapid Systems on a VERY interesting new product for the ham / hobbyist / industrial / academic community. I wish them success with it!

73,

Here are some answers to your questions as well as some general info
I think you and others might find useful.

First, satellites only transmit cloud pictures. Polar satellites
transmit a continuous strip of alternating visible and IR lines. Geo-
synchronous satellites transmit direct quarter-earth photos as well as
gridded polar shots reformatted and processed on the ground.

HF fax provides a varied menu of retransmitted satellite photes, weather
maps and news items. I have enjoyed watching hf wx maps come in from all
parts of the world. the USSR and PRC especially transmit maps that are
easy to receive and fun to watch.

Finally, Radar summaries are available by phone. I haven't tried that personally yet.

Here is some general info that might spark interest in FAX and WX satellite reception:

Satellites- There are two types of satellites available for use- polar and geosynchronous. The polar satellites are in high inclination orbits so that they cover all parts of the earth twice a day as the earth rotates under them. US satellites are on 137.62 and 137.5 Mhz and can be easily heard using a scanner with whip or ground plane antenna.
Russian satellites are on 137.15 and 137.3 Mhz and run even higher power than US types.

The geosyncronous satellites are in place above each country that put them up so basically only the US satellites can be heard. The Japanese, Russians and Europeans all have geosynchronous satellites in place. The US GOES types transmsmit on 1691 Mhz with FM modulation in the same format as the polar types. Output power is quite low so receiving stations must be elaborate. Dishes as small as 4 feet can be made to work with low noise preamps but 6 to 9 foot diameters provide more margin for losses etc.
It's customary to get a polar receiving and display capability up and running first and then to use the vhf receiver as the IF for the S band receiver.

Receivers- All satellite transmissions are in FM with various deviations.
The best compromise bandwith for all types is +- 15 khz. (30 khz total)
You can receive the satellites just to hear them on a standard narrow band scanner but a picture displayed would be badly distorted. It's easy to put a wide band filter in a scanner if that is the receiver chosen. There are a number of receive options available. See references that follow.

Display- Up untill recently it was difficult to display FAX. The choices were converted surplus

Circuit board specialists is run by Robert Shriner (w0uzo ?) and his
wife Ollie (wa0wad). Their products are excellent and the quality of
the boards are very good! I went to college in Pu-Town and I know the
family well. There are others working with them and they do all the
work themselves. All products are throughly tested and require little
debugging. Their amateur radio boards are their main area of expertise
and they range from complete RTTY and Repeater controllers to simple
keyers.

Highly Recommended!

--- Following is retransmission of an item sent a few weeks ago that may
___ not have be posted correctly to the net due to system problem.

     Some comments on SCA monitoring.

     Equipment

     First, I have had good luck with a SCA adapter made by
a company called Communications Poly Services, Box 3251, Westford
Mass, 01886. Their model is a SCA-3.

        By the way, FM stations also use 91 khz
subcarriers (the FCC currently allows anything between about 60 and
100 khz, I forget the exact limits), so a tunable means of looking at

subcarriers with some selectivity so it can handle multiple subcarriers on the same main carrier is very desirable.

Main Channel Audio Bleed into SCA channel

Unless the tuner any SCA adapter is used with has very good IF filters with nearly constant group delay across their bandpass, the main carrier modulation will cause phase modulation of the subcarrier to some degree. (This is in fact the principle behind many group delay measuring systems). This causes some unaviodable bleed of main channel audio into the SCA audio. The only cure for the problem is better IF filters (or better alignment of the ones you have)

I am told that the professional SCA tuners built for Muzak and other audio services use special ceramic IF filters that have almost an order of magnitude flatter group delay characteristic than the cheap Japanese filters that almost all (even high end) FM tuners seem to use.

I suppose that someone who is good at designing filters could design a phase compensating network given measured characteristics of an IF system, but for demodulating data it isn't really necessary to suppress main channel audio that many db. (I, for one, cannot stand Muzak so being able to listen to it completely free of main channel bleed is not a priority).

I have heard that many Muzak services use compressor/expandor systems a la Dolby or DBX which have the effect of suppressing perceived main audio bleed much further. (If you intend to actually listen to SCA programming you might try to find out if it is companded and if so re-expand it's dynamic range at your end - it will probably sound much better)

Actual SCA signals.

I have observed the following in the Boston area:

More or less standard Audio:

1. Muzak (some 10-15 channels of supermarket, store, and restaurant music, some almost listenable, some obnoxious)
   At least two stations carry the same exact feed (I think of real MUZAK) in very close time synchronism, I suspect that they get it from a satellite feed.

2. Readings for the blind of daily newpapers and magazines. (Three different stations carry this)

3. Audio of sister AM stations (a technique used to piggyback audio over a studio-transmitter link to a common transmitter site).

4. Physician's Radio Network (Will Martin's comments apply, I can't even interest my medical student wife).

5. NBC radio network feed (seen some years ago) right off the wire cue beeps and all.

6. Educational programing from local community colleges.

7. Audio of carrier current college AM station being distributed to power lines in dorms (seen some years ago) on sister FM station.

Non Audio signals:

1. Transmitter remote control and monitoring (in use for many years) Older systems transmit continuous .5-3 khz tone as FM on 67 khz subcarrier, tone's exact frequency represents meter reading. Newer systems transmit sequences of ASCII characters using start stop transmission on an FSK'd tone FM modulated on a 67 or 91 khz subcarrier (103 modem tones are sometimes used I believe since the chips are so widely available). What one sees on the FM transmitter output is usually telemetry reporting transmitter parameters (plate current, VSWR etc) back to the studio, by using the FM signal to do this the station can aviod having to pay for a telephone line. The command link to the transmitter is completed through a subcarrier on the studio transmitter link (which usually gets filtered out before the signal is fed to the transmitter)

2. Dow Jones Pocket Quote stock qoutes. This signal is 4800 baud asynchronous (start stop) transmission direct keyed (FSK) onto a 67 khz subcarrier with a shift of about 10 khz from mark to space. Mark is low and space high in frequency, the signal uses 8 information bits and a parity bit, and a stop bit. The qoute data is in a binary format that can be deciphered with a little effort, a variant of standard ticker symbols are used with prices in packed binary. I understand this service is or was offered in more than 100 cities. I am not sure whether the prices are delayed 15 minutes as is the standard for broadcast tickers or are live.

3. A direct 67 khz FSK keyed 9600 baud data stream carried by a local university radio station, that I am told contains a dial up bulletin board. Students can call the radio station and post notices which get broadcast every so often on the 9600 baud feed.

4. Paging services. I have been told that there are at least a couple of SCA subcarriers used for paging. I do not know what exact format the paging is in (whether it's start stop transmission of characters (using a UART or equivalent) or long strings of bits (using dedicated LSI)).

5. Remote control of electric utility loads. The local power companies are experimenting with controlling their off-peak

loads (such as cheap-rate water heaters) with SCA subcarriers. Currently two stations carry the 1070/1270 hz FSK 300 baud control commands as audio tones on a 67 khz subcarrier.

So far unidentified (I'm lazy)

6. FSK audio signal (known to be such from spectrum plot) carried as fm modulation on 67 khz subcarrier. Apparently frequency shifted from about 3khz to about 5.5 khz this carries 1 to 5 second bursts of what seems to be 1200 baud keying. I don't know what format the data is in or what information is carried.

Signals which I have heard or read are transmitted on SCA (but haven't actually seen or yet demodulated)

1. Commodity news service (CNS) frequency division multiplexed multi-channel low speed baudot commodity wires. This signal, which is in a format similar to that used to transmit low speed newswires to radio stations and newspapers for many years (since the mid 60's) consists of about 24 subcarriers at 120 hz intervals starting at a c.f. of 420 hz. Each subcarrier is FSK'd with a frequency shift of 60 hz from mark to space. Most of the CNS wires (there are different ones for different products) are transmitted at 56.88 baud in 5 unit baudot code. There are both 45.45 baud baudot and 74.2 baud baudot circuits on the CNS mux however.

2. Commodity pocket quote system. This is a similar system to the stock pocket qoute. A calculator size device picks up a SCA subcarrier and displays selected qoutes on a LCD display. I do not know if the format is similar to the stock qoute system (4800 baud direct FSK of a SCA subcarrier).

3. Dow Jones news stories. Some years back I saw ads for a Dow Jones service that would supply your home computer with late breaking financial news in various catagories (you could select). I was never able to actually see the SCA transmission for this service in the Boston area, but from the text of the ad it was fairly obvious that they were using SCA. More recently this kind of service has been supplied on a dial up basis by Dow Jones, and by Rueters through a spread spectrum transmission on a satellite that allows use of 2-3 foot dishes.

4. UPI and other wire services. A recent story about UPI's data communications said that they were having trouble with their satellite (they also use spread spectrum) distribution system in certain large cities where there are many 3.7-4.2 ghz terrestrial systems in use, and that they were going to use SCA to distribute wire services. I do not know what format they are using (could be similar to CNS) and would greatly appreciate hearing from anyone who knows of any actual wire service

SCA transmission anywhere (I'm writing a usenet story on picking up wire services). [I know of a local FM station which has been thinking about using a 91 khz subcarrier to relay their AP service from their transmitter and studio site to a remote news studio to save money on telephone lines.]

5. Nationwide paging. There has been much talk of setting up a nationwide paging system that would use SCA subcarriers fed from a satellite downlink to simultaniously page people over very wide areas. Paging receivers would look through their local FM spectrum to find the station carrying the paging. At one time PBS was going to rescue themselves from Reagan's financial oblivion by selling this service through all the National Public Radio outlets. I believe I have read that while this fell through, someone else has tried to set this network up.

6. Software distribution. There has been talk on and off about broadcasting home computer software over SCA subcarriers. I have read about experiments involving transmission of programs on telephone request (you call up and ask for a copy of Zorc or whatever and they send it - possibly encrypted - over the subcarrier.) I think the idea is that it is a lot more efficiant to send a program at 4800 or even 9600 baud through cheap SCA hardware than 300 baud over phone lines.

7. Electronic mail. It has also been suggested (and supposedly tested) that SCA subcarriers could be used as a distribution medium for electronic mail. I would hope that encryption would be used .

8. 32 Kb data. The FCC has just recently authorized transmission of data on SCA subcarriers at 32 kb (the old maximum rate was 9600). I do not know if FSK or QPSK modulation is to be used. I have heard that the new digital satellite terminals used for distribution of most of the major radio network feeds explicitly support several 32 kb data channels, and that there is talk of a common carrier like data transission service (with all sorts of things multiplexed together a la SSS on WTBS) which would carry a variety of feeds for different nationwide user communities.

Some Audio services heard of but not heard ...

1. Traffic reports broadcast to commuters in their cars.

2. Commodity prices for farmers.

3. Financial news and commentary.

4. A dentist's office background music and information service

And if you thought this was enough, has anybody looked at the subcarriers on the sound carriers of their local TV stations ? TV stations are allowed, just as FM stations can, to transmit various narrowcast services on subcarriers on their sound carriers. Much of the available spectrum will go to the new stereo sound signal and the secondary audio (bilingual signal), but there is space reserved for other uses.

The principle use for TV subcarriers I have observed is cue channel audio for Electronic News Gathering (ENG) teams. The director in the studio talka to the "talent" over this link since most of the microwave systems used to relay the video are one way only and there is therefore no backchannel (except VHF/UHF radio). Many of these ENG subcarriers are at 40 khz or 55-60 khz (pre stereo).

Another use of TV station subcarriers is transmitter telemetry. For years some of the Boston area stations transmitted a 40 khz FM subcarrier carrying a FSK modem signal modulated by a repeating pattern of bits (similar to satellite PCM telemetry formats). Yet another use of such subcarriers is paging of station employees, I beleive that both analog and digital transmission has been used for this purpose on TV sound subcarriers.

Tapping directly off the discriminator on the FM audio chip in a VCR might be good way to pick off TV sound subcarriers - TV's have all that horizontal sweep energy floating around waiting to get coupled into your receiver so it might be difficult to get enough signal to sweep harmonic ratio to reliably receive the transmission. (Purists may note that getting a good SNR on any intercarrier sound system requires care - the new stereo TV's use various tricks to solve the problem but a random tv or vcr may not supress harmonics of 15734 hz very far on it's discriminator output)

___ The following item was posted some months ago at a time
--- our network interface system was acting up - it may not have gone out ..
--- bear with me if you've already read it ...

Does anybody know if any of the 1200 baud diphase psk Navy fleet broadcasts from the geosynchronous UHF fltsatcom spacecraft carry UPI, AP or weather channels in some format that an ordinary mortal (very far from NSA level as a cryptanalyst) can recover with a suitable computer program ?

In the old days (late 60's to mid 70's) the Navy fleet broadcasts on hf (and lf) 85 hz shift 16 channel fsk fdm ssb used to carry 100 wpm weather circuits; sometimes special fdm transmissions to particular fleet units could be found with AP or UPI broadcast wires (from either Baltimore Md. or Norfolk Va.) on at least one tone. From time to time the UPI low speed A newspaper wire would be included also. In all cases these channels would be 7.42 (or 7.50 for AP) unit baudot code start stop at the same baud rate as they are on the wire services themselves. More recently it has been reported that certain hf fdm mux tty transmissions carry a 100 wpm AFRTS circuit which retransmits national news from both the AP and UPI radio wires slightly delayed.

It is presumably true that the signals were transmitted on hf just as they came off the wire so as not to compromise crypto security by broadcasting an encipherment of a known text. Perhaps if the Navy supplies the same stuff to it's (larger) fleet of ships these days it also sends it in the clear on the fleetsatcom psk broadcasts that are now the primary method of transmitting to ships at sea ?

I've always assumed that nothing else on the Navy fleet transmissions including the most routine UNCLAS stuff was breakable by an amateur (or even most governments), as I suppose it is enciphered by more or less the same crypto as used for high security stuff but set up from another key list. It is true, however that US low speed tty crypto systems use a start-stop to synchronous transceiver (more properly isochronous as no separate clock is transmitted) and it is at least remotely possible that certain very routine unclassified traffic is transmitted in synchronous format without benefit of a real key from the key generator (perhaps some simple sequence is used simply to keep transition density high for the clock pll). (If anyone knows, and can say anything about low security modes for unclassified traffic I would appreciate hearing from them.)

The uhf satellite transmissions are relatively high power (nearly whole transponder) signals on various frequencies between 249 and 261 mhz,

they carry a 24 hour a day 15 channel time division multiplexed stream of mostly crypto circuits. The multiplexing is straight tdm with a 16 bit wide frame, each frame consists of a framing bit and one sample (bit) of each channel sent sequentially starting with channel 1. Frame sync is obtained by detecting and locking onto a continuously repeating pattern in the 16th bit position of each frame. 1200 baud divided by 16 yeilds a channel bit rate of 75.0 baud which is the standard rate for 100 wpm enciphered baudot tty traffic. It appears that the 1200 baud rate is exactly that (out to several places) so no bit stuffing is being done (understandably enough).

The modulation is differential diphase mark (phase shift of 180 degrees for every mark (one bit) and 0 degrees (no shift) for every space (zero bit)). Recovery of the data requires little more than a simple Costas loop to recover the bit stream, and a bit clock recovery circuit to regenerate the 1200 baud clock. TDM frame and bit clock recovery could be easily implemented using a Zilog 8530 SCC chip which incorperates a transition tracking digital phase lock loop. The 8530 SCC chip could be fed data directly (after a schmitt trigger) from an in-phase phase detector on the Costas loop, as it has a NRZI mode which will allow it to recover data as it would appear at that point. Obviously the 8 bit data coming out of the SCC would represent alternate halves of the 16 bit frame, and would not necessarily be in frame sync.

The signals are powerful enough so a modified scanner (or one of the new scanners which cover the military uhf band) ought to suffice as a receiver, although the best reception might be had with a down converter and a hf receiver with medium (say 4 or 8 khz) if bandwidth. The Costas loop would connect to the receiver at it's low IF (455 khz for most receivers and scanners) after the selectivity to reduce the noise bandwidth. Antenna requirements are pretty minimal, but a small crossed yagi or helix aimed at the right point in the sky for the particular satellite of interest would be ideal.

Has anyone explored these signals ? Are there any other military satcoms (say the X-band DSCS spacecraft) which carry readable traffic ?

Having been off the air for several years, I have the urge to set up a shack again. The new generation of synthesized rigs look very attractive for several reasons. The inclusion of a general coverage receiver is nice because the XYL is interested in listening to shortwave broadcasts (I hope the first step toward a ham ticket). The ICOM 751 looks good on paper, but I've heard it is prone to reliability problems. Any feedback on the new ICOM, Kenwood, and Yaseau rigs would be most appreciated.

Futhermore, if anyone has any recommendations as to a dealer within a several hour driving radius of NY who is competent and has low prices, that would also be most helpful. Any comments about Barry in NYC or Harrison on Long Island?

Many thanks

JIM,

YES YOU CAN HEAR THE PHONES ON YOUR UNIDEN 2021 (I HAVE ONE AND
HEAR THEM). FROM ABOUT 1.65 MHZ TO 1.85 MHZ I HAVE HEARD THEM. YES
THEY ARE ON FM, BUTBY SLOPE DETECTION, TUNING SLIGHTLY OFF THE
CENTER OF THE SIGNAL, YOU CAN COPY THEM. I HAVE HEARD ABOUT 8-10
DIFFERENT PHONES AROUND MY AREA ON MY 2021.

GOOD LUCK,

MIKE, K6ICS

I was curious about the large dish on the lawn of the Dow Jones
New Service building in my town. I still don't know what it's used for,
but a search of the FCC records revealed:

  MHz   call   licensee
3700.0000   KRO60_____Dow Jones [Naperville] (govt recds)
3925.0000   KRO60_____Dow Jones [Naperville] (govt recds)

I looked into Equatorial quite completely some time ago. Their
big problem is that they are very expensive. The RO dishes cost
about 4X as much as for conventional TVRO, and their channel
time costs are very high. Their equipment is only usable for their
service, and they consider all their encoding techniques to be
proprietary.

      SPREAD SPECTRUM FOUND IN THE 160 -170 MHz BAND

     Who is using frequency hopping, spread spectrum emis-
     sion in the 10 MHz between 160 - 170 MHz?

     I've monitored daylight transmissions of this type
     using an   HP8558B spectrum analyzer and outdoor ground
     plane. The signal strength on each discrete frequency
     is   constant, about 10 db stronger than the Chicago's
     NOAA Weather Radio station on 162.55 MHz (35 miles east
     of me, atop Sears Tower).

Of course, you could just solder 5 pieces of 1/8" brazing rod into an SO-239 connector and get the same thing for about $1.50. Trim the rods to about 19" and bend the radials down at about a 30 degree angle, and voila! Screw the coax on it, and drop it into the end of the antenna mast. Or use a dual pipe clamp from the hardware store. (Another 75 cents).

Bend the radial up and down if the SWR isn't right.

If you're going to run over 250 watts, maybe a teflon connector is worth it. So now the whole thing costs $3.00.

I'm cheap.

LISTENING TO FM USING A SHORTWAVE RECEIVER

AJ9S

> I HEAR A LOT OF NBFM IN THAT SERVICE. SOME CAN BE (INEFFICIENTLY)
> RECEIVED USING SLOPE DETECTION ON AN AM RECEIVER BUT MANY ARE NG. I
> THOUGHT THAT THERE MIGHT BE A SIMPLE WAY TO RECEIVE THESE PHONES.
>
> TNX!
> JIM

I grafted an old Hammarlund SP600 ("Super Pro") general coverage receiver to an old Motorola land mobile FM receiver strip (A Series) by joining both of them at the 455 kHz IF stage.

This allowed 2 new capabilities:

1. allowed FM reception of HF by using SP600 front end, Motorola detector/audio/squelch.

2. allowed AM, CW, SSB reception on VHF using the Motorola front end and SP600 IF/BFO/amplifier

Most scanners are double conversion, with IF's of 455 kHz and 10.7 or 10.8 MHz. Most swl radios have a 455 kHz IF stage somewhere. You can crossbreed the two radios to get more capabilities out of the equipment you have.

Have fun.

I have no specific knowledge of the scheme used for UPI, but the NAVSTAR (GPS) satalite navagation system uses that form of spread spectrum. One of their modes used 10 Mega "chips" per second, and a PRS with a repeat period, at that clock rate, of 287 days. (They actually only use one week long subsets of it, asigning a different subset to each bird, and they reset the sequence once a week.) The badwidth they claim to use is 20MHz, so I would guess that if the UPI system claims to use 2MHz that their clock rate is about 1MHz. An interesting feature of the NAVSTAR system is that the spread signal is below the noise as received by the typical earth station. If I had to guess, I'd say that the UPI system tries for that too, and considers it a feature. When you unspread the spectrum at the receiver, the signal comes back up, but the noise stays down. However, with a decent FIRE code, corelation drops to zero by the time you are 1 "chip" timeout of phase with your unscrambling PRS. Even with a reasonably short PRS, if you don't know what is, and they are running below the noise, you don't have much of a chance of finding it, even if you know the carrier frequency. (You could camp next to the uplink transmitting antenna, it should be well above the noise there on the uplink frequency.) As to encryption, you might get lucky. If I were using such a system for secure purposes I wouldn't use any. I'd just make the PRS longer and/or change it frequently. FIRE codes are a dime a dozen.

               TIS Radio Stations
```

Traveller's Information Service (TIS) stations transmit road and parking information to the public. Most TIS stations use AM, less than 10 watts, and are allocated either 530 or 1610 kHz.

Here's a list of all the TIS stations licensed by the FCC on 1610 kHz as of about 1 year ago. I've tried to include exact transmitter locations, rather than control points. A list of 530 kHz TIS stations is in the works.

One of the more unlikely spots for obtaining gear that I have
found is Radio World, located in the terminal building of
Oneida County Airport in Oriskany, New York (near Utica).
As part of a trip last week to that part of the woods, I
wandered in.

I seem to remember a posting to this list recently about SW receivers
for the car. At Radio World, I noticed that MFJ makes a four-band
SW converter about the size of two packs of cigarettes and costing $79.
I needed to catch a plane, so I didn't have the time to get any further
info.

Also, from the Radio Nederland shopping list: SW auto receivers
by Grundig, Becker, and Philips and SW converters by Becker and
Grundig.

Unfortunately, these nifty ground planes often end up "sort of" working, but not nearly as well as they theoretically could. The pattern tends to spray upward, leaving a null at the horizon where you really want to radiate.

Another configuration which tends to work much better, is cheaper and easier to build, and is MUCH more portable if you want to take it on vacations, etc., is the COAXIAL DIPOLE.

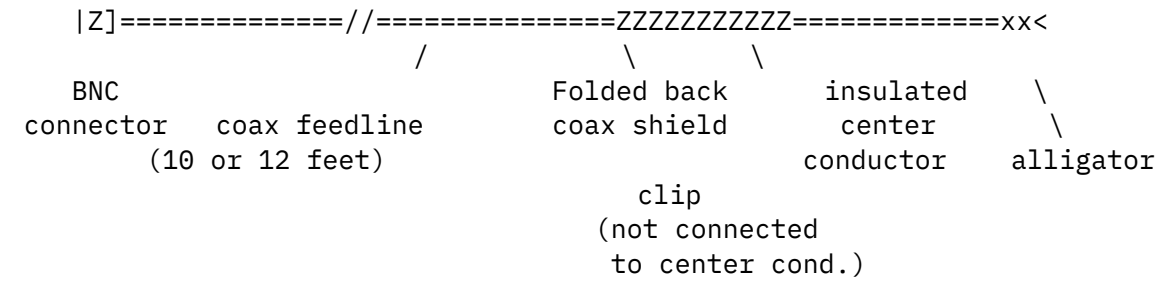
Take a piece of RG-58/U or RG-59/U and strip off the outer insulating jacket from about 30 inches of it. Then work the shield braid back along the coax until it loosens up and then fold it back over the outer jacket that remains. This is a little tricky until you get the hang of it, but eventually you will find it not hard at all. The trick, as I recall, is to let the shield bulge out at the point where it is held by the jacket, and it will start folding back over the jacket quite easily.

Anyway, when you get it folded back, pull it up tight over the jacket, stretching it out in the reverse of its original direction. Trim it off to about 18 inches. You may eventually trim it down to more like 16 or 17, but it is easier to shorten than to lengthen it. You can adjust the effective length somewhat by adjusting how tightly it is stretched. You can tape or glue the end in the final position that you like best. I have found the cyanoacrylate "crazy glue" products to work well for this purpose.

Note that in stretching the 25 or 30 inches of shield over the jacket, it loses a lot of length, and there isn't as much to trim as you would think given the above instructions.

As for the center conductor, you will want to cut it off at about 19 inches. I have done this in several ways, but the best was to work the conductor and insulation back and forth until the conductor broke off and could be pulled out of the insulator leaving a few inches of extra insulation. Then I attached an alligator clip to the free end of the INSULATION ONLY, far from the end of the center conductor. The alligator clip then serves as a convenient fastener for hanging the antenna on a curtain rod or whatever. Another method I have used is to clip off the whole thing at 19 inches, pull the conductor out of the clipped-off piece, fasten the clipped-off piece of insulation back to the end of the antenna with a crimp-type "butt connector" and then crimp on the alligator clip as before.

Put a BNC connector on the other end of the coax and you have a very effective 2m antenna. The whole assembly looks as shown below:



The folded back shield must be somewhat shorter than 19 inches to resonate properly. I would guess about 16 inches, but by experimenting you may find a better length. The free end of the center conductor should be about 19 inches, maybe slightly less because of the increased dielectric constant of the insulator as compared to air. I have had no trouble getting a VSWR of around 1.5 to 1 with RG-58/U coax. This is about par for the course, since the antenna feedpoint impedance is around 72 ohms theoretically.

For 2-meter FM operation, of course you want to hang the thing vertically. The clip on the end makes this convenient. You will want the overall length of coax to be about 10 to 15 feet to permit accessing the antenna from a convenient spot in the room when it is hung near a window or something.

This is a mighty handy accessory for your 2m Handie-talkie if you spend much time on trips -- it coils up compactly and fits easily in your suitcase or briefcase.

==========

Now, if you want to get SERIOUS about 2m antennas, get one of Dick Austin's

Model 264 "DFQer" units for about $60.00 list, and I guarantee you that you will notice a dramatic improvement over the kind of antennas discussed above. Dick's phone number is (603) 887-2926 (Sandown NH).

gridded polar shots reformatted and processed on the ground.

HF fax provides a varied menu of retransmitted satellite photes, weather maps and news items. I have enjoyed watching hf wx maps come in from all parts of the world. the USSR and PRC especially transmit maps that are easy to receive and fun to watch.

Finally, Radar summaries are available by phone. I haven't tried that personally yet.

Here is some general info that might spark interest in FAX and WX satellite reception:

Satellites- There are two types of satellites available for use- polar and geosynchronous. The polar satellites are in high inclination orbits so that they cover all parts of the earth twice a day as the earth rotates under them. US satellites are on 137.62 and 137.5 Mhz and can be easily heard using a scanner with whip or ground plane antenna.
Russian satellites are on 137.15 and 137.3 Mhz and run even higher power than US types.

The geosyncronous satellites are in place above each country that put them up so basically only the US satellites can be heard. The Japanese, Russians and Europeans all have geosynchronous satellites in place. The US GOES types transmsmit on 1691 Mhz with FM modulation in the same format as the polar types. Output power is quite low so receiving stations must be elaborate. Dishes as small as 4 feet can be made to work with low noise preamps but 6 to 9 foot diameters provide more margin for losses etc.
It's customary to get a polar receiving and display capability up and running first and then to use the vhf receiver as the IF for the S band receiver.

Receivers- All satellite transmissions are in FM with various deviations. The best compromise bandwith for all types is +- 15 khz. (30 khz total) You can receive the satellites just to hear them on a standard narrow band scanner but a picture displayed would be badly distorted. It's easy to put a wide band filter in a scanner if that is the receiver chosen. There are a number of receive options available. See references that follow.

Display- Up untill recently it was difficult to display FAX. The choices were converted surplus mechanical machines or homebrew crt systems. Now the display of choice is a pc driven scan converter. This software intensive approach provides much improved flexibility to receive the wide array of differrent formats and line speeds used by the various FAX services. Apparently for reasons of processor speed the Radio Shack Color Computer has been the computer of choice for much of the software development done to date. Certainly this software can be converted to other machines. See reference that follow for more info.

References-

1. There is a journal called "Journal of the Environmental Satellite Amateur Users Group". Quarterly @ $14.00 per year (cost may not be exact)

by Raul Alverez (WD4MRJ) 2512 Arch Street Tampa FL. 33607. A must have item.
Contains recent news and articles about all phases of WX satellite reception.

2. 73 Magazine Nov and Dec '84. Gives a complete description of a pc
driven scan converter including discription of hf(same as SSTV) and WEFAX
front ends. Includes sources of boards, parts and software. I'm assembling
one of these systems now. Back issues may still be available at a well stocked
ham store.

3. "New Weather Satellite handbook" by Dr. Ralph Taggart. Available at well
stocked ham stores. The bible on all phases of WX satellite activity. A
little out of date in that it doesn't include new scan converter material.
Taggart is one of the co-authors of the 73 articles above.

4. NOAA has a coordinator for users of US WX sats. Also publish a
newletter quarterly with schedules, formants and other info.
Contact is Robert Popham. Try reaching him to request newletter at:

Dept. of Commerce
National Oceanographic and Atmospheric Association
National Environmental Satellite Data and Information Services
Washington D.C. 20233
attn: Robert Popham

5. There will be a broad spectrum users conference in the Wash DC are
the week of April 15 to 19. Get ahold of Popham for details. Includes
papers, equipment demos, amateur displays, tours etc.

I hope the above is useful info for those interested in this little known
but fascinating amateur/swl activity.

Regards,
Randy Davison

I ordered several boards from Circuit Board Specialists with no problems. The only complaint I have is that (as stated in their catalog) they DO NOT provide a layout for their boards- you're supposed to get them from QST etc. Or you can figured it out for yourself.

GEORGE WB6YZZ

p.s. Their boards were excellent quality!

One of the things that I have missed since moving to Colorado is attending hamfests. Even though I am not a ham (radio ham, that is), I find hamfests a lot of fun and the source of some great bargains. In the last few days I found out about the following hamfests, which I am posting.

I would be grateful for the posting of information about other hamfests. I have not seen this type of information on the net before.

I need help in locating a manufacture of
open wire feedline.

Any help in locating some would be appreciated.

thanks
mike hudock

Does anyone have a set of programs for UNIX that use these tables? Perhaps
even with a graphics style output?

Summary:

I bought a Uniden 2021 a couple months ago and have been relatively happy
with it. Strong stations like BBC, HCJB, etc. I pull in with no problem
and I have listened to Kol Israel's programs regularly though the reception
on that has been considerably weaker. I have not been able to pull in Israel's
Home service at all. The question I have is what things I could do to make
reception better. I now have a piece of Radio Shack 18 gauge copper wire
strung uup along the side of our apartment building. Should I try to put
an antenna on the roof of our two story building, an active antenna, add a
preamplifier or something like the Grove minituner? What would be most
helpful? And what brand of product? Any other suggestions?

qst de k9eui

hr propagation forecast bulletin nr 11 from arrl headquarters

newington ct march 17, 1985

to all radio amateurs bt

in 18 days ending march 16, the solar flux averaged 69.9, and was never above 71. the rise predicted last week began march 12 with the flux at 69. it was 73 on the 17th, its highest value since february 21, and is expected to rise for another two days or so. this could make a noticeable improvement in the 21 and 14 mhz bands, and wake up the 28 mhz band, at least on transequatorial circuits.

with wwv a indices below 10 most of the time, propagation on the active frequencies was fairly good in the past week. geomagnetic activity is expected to rise this week, which will hamper propagation in the higher latitudes. the vernal equinox this week marks this period as the best of the year for propagation on north south and other transequatorial paths on all amateur dx frequencies. the authors florida log for last year at this time shows our first 50 mhz te qso, with lu8yyo, on march 18. work with south and central america was done almost daily thereafter, from the southernmost states, and intermittently from most other areas, for several weeks. the much lower solar activity currently may keep the te mode from working on 50 mhz this year, but now is the time to be trying.

propagation is expected to be generally fair to good most of the forecast week, with the muf running a bit higher than it has been recently. conditions will be less favorable toward the end of the week in the higher latitudes, as geomagnetic activity rises, but no serious disturbances are likely until about march 26.

correspondence regarding these bulletins should be addressed to the author, ed tilton, w1hdq, po box 5529, spring hill, fl 33526, until early may, and to the callbook address thereafter, until further notice.

american sunspot numbers for march 7 to 13 were between 11 and 0 with a mean of 5.6 ar

Outdoor Antenna vs. Indoor Active Antenna, etc.

Without a doubt, putting an antenna on the roof will yield the biggest improvement, and at a lower cost per db. I have an MFJ 1020 active antenna and an Ameco preamp. They are ok, but not as good as a mediocre wire antenna on the roof would be.

My choices for a simple SWL antenna, in priority order, are:

1. A coax fed trap dipole for multiple shortwave bands

2. an end fed long wire and a simple SWL antenna tuner to match unbalanced lines (MFJ or Grove Minituner III [$39]).

3. Center fed Zepp, of length = 468/[lowest freq you want to cover in MHz], parallel feed line (good grade of jacketed twin lead), and antenna tuner to feed balanced line

I'm a non-ham, so I've come here to ask the experts for help. I recently
bought a wireless FM intercom for my house (two-station). It works fine
until I turn the TV on, then buzzes like mad. I tried a Radio Shack AC
line filter, but that didn't have any effect at all. It also makes the
noise no matter how far from the TV either station is.
So, what is causing the buzz? Is my TV xmitting through my wiring, or
might it be some other kind of interference? And how do I quiet the little
bugger down?
Any suggestions or info would be appreciated. Please send direct to me,
or post to this BB if easier.

   Thanks in advance,
      John (DINGMAN@RADC-20.ARPA)

I HAVE INCREASED THE SENSITIVITY OF THE 2021 BY AT LEAST 10 DECIBELS AT ~4 MHZ BY SIMPLY USING A RESONANT LOOP ANTENNA. ALL THAT IS NECESSARY IS TO USE THE ANTENNA WIRE THAT CAME WITH THE RCVR AND PLACE A 100 PF VARIABLE CAPACITOR BETWEEN THE "FAR" END AND THE GROUND TERMINAL OF THE RCVR. (AN AUDIO TAPE REEL, ~5 IN OD, MAKES A NEAT WAY TO STORE THE UNUSED SLACK IN THE WIRE.) I JUST LOOPED THE WIRE AROUND A WINDOW BEHIND THE DRAPERIES.

GOOD LUCK!

JIM (W2OZH)

FYI, Indiana charges $40.00 (above & beyond the other fees) for the
vanity plates, but only $2.00 for ham plates......Just thought that
info might help with another example......Dave

*** Correction to text - discard previous version.

" What is the proper configuration for hooking up an MOV to a power
  line? (i.e. in series or in parallel?).

  If it hooks up in parallel to the power line, why wouldn't one MOV
  work for your entire house? It seems that it would, because all the
  lines in the house are connected to together in parallel.
                                    Joe   "

The MOV is a shunt device: it has a high impedance until a transient causes
a large voltage to appear across it, at which point its resistance becomes
small, or more precisely, it prevents the voltage from getting much bigger
by shunting a large current through the MOV.

To protect equipment with MOVs connected to the AC line, you would want to
choose an MOV rated for a voltage which would not NORMALLY appear across the
line. Be sure to find out (does anybody know?) whether the MOV is rated in
terms of instantaneous peak voltage or RMS line voltage. The peak voltage
is sqrt(2) times the RMS value of 115 or 120, thus about 170 volts. To allow

for manufacturing tolerances, an MOV which limits peaks to about 190 or 200 volts would probably be about right.

Another parameter you need to choose is the maximum shunt current you need to handle in the MOV. The right choice depends on the application. For EMP protection, FEMA recommends a rule of thumb of 25 to 120 Amps per FOOT of exposed conductor if the conductor is vertical and 5 to 10 Amps per foot if it is horizontal. In either case, a practical limit would occur at about 2000 Amps because more than that will arc over around even your MOV. So probably a 2000 Amp peak current rating would handle most transients in the real world. I'm not sure just how LIGHTNING transients would differ from EMP, but it is generally claimed that the risetime is longer (slower) for lightning. I suspect that the above rules of thumb for EMP would result in a conservative design that would handle lightning nicely also.

**** correction to following paragraph: ****

The MOV would be connected across the line (in parallel, in your terms). A single MOV at the power entrance point would be very useful if all wiring beyond that point is in metal conduit. MOVs have a reputation of being fairly reliable, provided that they are adequately rated to handle the shunt currents they experience. However, the use of two or more MOVs in parallel might be a good idea for added protection in case a failure should occur.

Bear in mind that both EMP and lightning are fairly wideband phenomena, EMP particularly extending well into the VHF region. Because they are so wideband, they act like (they in fact ARE) radio waves and can get picked up by even a few FEET of conductor betwee the "central" MOV and the device in question. MOVs at various other points in the system would provide better protection to specific (expensive) equipment especially if the entrance-point MOV(s) failed or if the distribution wiring in the building is not shielded.

The LEAD LENGTH and inductance in series with the MOV will greatly reduce its effectiveness in limiting voltage peaks. It is best to use techniques similar to those used in building VHF/UHF amplifiers: very short leads, wide "straps" rather than ordinary wire, or else large diameter conductor, avoid bending the conductor (because bends introduce inductance) etc.

Additional protection can be provided more locally by using Zener diodes on low-voltage lines and gas gap devices on antenna feedlines. NOTE THAT AIR GAPS ARE NOT EFFECTIVE against EMP transients because the risetime is much faster than the time required to ionize air. Buy a gas discharge device specifically designed for EMP or lightning protection, and then check it periodically (after every major electrical storm, for example).

I hope the above is helpful. Please note that I am only an "instant" expert on this subject rather than a "real" expert, so I may not be able to give you much more detail than the above. However, I would be glad to try to answer any further questions or point you at someone who can do so.

To New Hampshire Hams:

Ham call plates ARE vanity plates. They serve no purpose but to boost the ego of their owner. There is nothing wrong with that. I have call plates. They are one of my toys. I pay for my toys, but I don't want to pay for other peoples toys. Don't ask the taxpayers to subsidize your toys.

If the reasons that you choose to live in New Hampshire include the fact that our government costs are so low that we have a budget surplus with no state income tax and no state sales tax, then you cannot, in good conscience, support the moves to make ham call plates "special"(==cheap==subsidized). If you want special interest groups to dictate your tax rate, you aren't likely to be happy in this state anyway.

If National Guard plates serve no useful purpose either, then you thrust should be to have their special status eliminated, not to put your own hand in the til. If they do serve a purpose (I don't know that), then whether they should be given a reduced rate or should be reimbursed directly by the Guard is a separate debate.

If ARRL really is supporting this foolishness, then shame on them!

I urge you to write the governor and your state representatives and register your opposition, as a ham, to casting ham radio in the roll of another special interest group with its hand out. All that we should ask of out governments is the continued use of our frequencies. That is plenty to be grateful for already.

Sincerely,

Bill Freeman, KE1G

The rationale behind reduced rate license plates for hams and National Guard members and doctors... is that if not explicitly (and hams do explicitly) than at least implicitly these groups exist in part to perform public service.

In having these distinctive license plates, they are easily identifiable by law enforcement and civil defense and could be put to use in emergency situations.

Some states, in fact, require that a vehicle with call sign plates be equipped with a two-way rig. This can be as little as an HT. This only makes sense.

When the Registry of Motor Vehicles in Massachusetts restructured the registrations rates, ham plates were classified with MD's, not with vanity plates.

I don't think that hams are looking for a free ride, but rather recognition of their contributions, and the opportunity to provide a service to their communities and to the public at large.

One last comment. I grant that many hams don't view their hobby as I have portrayed it. That's too bad. For those of us who perform even the occaisional public service deed through the use of amateur radio, being identifiable by callsign plates is an important thing.

That is not true. You have three wires in most power receptacles
today. At the frequencies represented by the rise-time of spikes, the
two ground-wires (or neutral) may not be zero impedance from one
another. Thus three MOVs is a good plan. You need also to have
indicating fuses in series with each of the MOVs to know when they
have been wiped out and need replacing by a particular heavy lightning
stroke.

The situation you describe, where Amateur Plates are considered public
service plates, is true for Virginia. Virginia requires (or still did the
last time I checked) that a vehicle carrying an Amateur Radio plate have
working communications gear. You were also required to turn in your plates
if you were without such gear for longer than 90 days. The law wouldn't
allow holders of Novice licenses to obtain Amateur plates because of their
perceived inability to provide mobile communications... even though I have
run into at least one Ham who did mobile CW.

The Virginia State Police WILL use you in an emergency situation if they
see Amateur Plates on your car. One of our club members, coming upon a
traffic accident, was signaled to the side of the road by one of Virginia's
finest. He expected to be asked for communications help, but was asked to
help push one of the vehicles out of the roadway.

That's public service!

-rick

ps. I wasn't able to convince my mailer to send directly to the MIT-*
addressees that posted the original messages concerning amateur plates
as vanity plates.

Ham tags = vanity plates ?? Bah Humbug!!

Now wait. Yes they are. To some extent they are. I have been a "HAM" for 23 years and I am proud of it. But as someone else said, they are mainly to assist the proper authorities to identify the owner in times of emergency.

Alabama has been in the middle of "TORNADO ALLEY" for the past several years. Many many hams in Alabama actively work with the National Weather Service during periods of severe weather watches and warnings. These same hams then work closely with Civil Defense, the Red Cross and local law enforcement officials if a storm does strike. And they do, several times a year in this state.

I have taken part in too many severe weather watches and warnings to count. Three times I have also actively assisted after a tornado touched down and did much damage. Each time I was admitted to the area on the basis of my call letter plates while all other folks were being turned back.

Being a "HAM" in this state means something to the State Troopers and to local law enforcement agencies. We have rightfully earned their respect. More than once a State Trooper or other lawman has passed me on the highway, and waved just because of my ham tags.

"HAM TAGS" are vanity plates??

I say hell no!! Come on down to this here Red Neck state and see!!

I have logged a couple dozen of what I believe to be MOORE RTTY stations
on HF. They are usually sending what sounds like 2 alternating "idle"
characters most of the time. Also, the transmission is definetly
synchronous and about 50 baud.

I have asked before if anyone really knows who these stations are,
and exactly what format is used (I heard that every other character
is reversed, ie; one character has a 4/3 mark to space ratio and the
next has 3/4). I would like to build a converter to eavesdrop on these
guys so any info would be helpful.

Oboy, another HOT CONTROVERSY !!!

Ham plates are NOT just vanity plates !! What if some constable finds that
his radio just went out and he needs a HAM to patch him through to his home
precinct? What T H E N ? ? ? If the next passing ham doesn't have his
callsign plates on because he is too destitute to pay "vanity" rates for them,
the public interest will be poorly served indeed!

Or what if some little old lady gets run down by a car and wants to flag down
the next passing ham to call for help for her? Wouldn't HER interests be
better served by allowing Joe Ham to have callsign plates at discount rates?

C'mon, guys (and gals!) -- let's get another barrage of flame-type messages
(known in the good old daze as diatribes) going!

It is my personal experience that most law enforcement officials
don't know what callsign plates mean. Also, we are not prevented from

marking our vechicles with the fact that we are hams by means other
than callsign plates. Means that would be clearer to the non-ham, in
fact. Means that don't involve dipping into the taxpayer's pocket.

The requiring a car with callsign plates to be radio equipped sounds like
something between useless and a bad idea. If Joe (Jill) Ham's non-ham spouse
needs the car for the day does he have to send his only HT with her (him)?
If so, is she of any use to someone who needs radio communication? Or
perhalps he (she) has to go along for the ride?

(Ron, are you on packet yet? I'm running a W0RLI BBS here in Goffstown.
You should be able to digipeat to me via W0RLI or K1BC or K1UGM, amongst
others.   Happy dancing.)

But suppose a ham is walking down the street, and a Trooper whose
just broken his mike cord trying to draw his gun passes by. How's
he going to know that the ham is a ham with his HT in the grocery
bag that he's carrying? Shouldn't we all be required to wear
sandwich signs with our calls when we're not in the car, and get
our employers to put neon signs on the side of their buildings that
can be turned on when we're there?

I don't need to rationalize my desire to have call plates. The forms
of recognition that I get when I help out with a public service event
mean more to me than my call plates, though, and they're something
I can't just go buy on account of having passed my FCC exam, as I can
with call plates.
              73 -Bill KE1G

This past week I got a short look at the IBM PCnet documentation. I find,
as you doubtless know, that this is a "broadband" (ie. cable TV based)
local network. Why I View With Alarmh Alarm is that it is in the six meter band,
my favorite. The PCnet carrier frequency is apparently 50.75 MHz. Since
the bit rate is 2 Mb/s, it will spread out quite a way. The thing doubtless
meets the FCC radiation specs, but they aren't very strict in terms of
an in-house PC along with weak-signal six meter reception. It would
likely wreak havoc with meteor burst reception. The saving grace could
be that a lightly loaded packet net doesn't transmit much of the time.

Has anyone had any experience with interference from PCnet? I should get
back on six packets some time soon - worked Florida that way last fall.

Heard a U.S. ham on the air yesterday claim that VEs can use the prefix
CG so I checked with the local DOC office and gathered this info for
those of you out there that hunt prefixes.
CG is a valid prefix from Feb 17th to Apr 17th in honour of 75 years of
     Girl Guides (!!!)
XJ is valid from June 29th to Aug 29th (I think it is Canada wide but is
     definitely valid for VE5)
CH5 is valid for VE5s ONLY from July 28th to Aug 10th to celebrate
     Saskatchewan Heritage '85.
It's not easy to find out about these things as there is no official
announcement mechanism. I'll try to keep you posted.
I don't hunt prefixes myself but if anyone really needs a special prefix
from VE5 land, mail me and we'll try a sched.

Actually one MOV would not work at all. You would need three,

MOV from :
     Hot to Neutral
     Neutral to Ground
     Ground to Hot

This protects the circuit from transients on any or any two of the
three legs of the feed. The real trouble is that the entire load of a
house can tax the MOVs unless you get the more expensive rated MOVs,
and besides most of the devices in the house are insensitive to
transients.

Second, the MOVs on the feed box would protect sensitive equipment
from the outside transients, but would not filter out the transients
that originate within a house. Yes the MOVs would trip and suppress
the transient, but also the power suppies of TV's, computers, etc
would also see the transient since they are on the short side of the
transient, so these devices would not have adequate protection.

The best advice is to install the MOVs as close to sensitive equipment
as possible and if you put MOVs in a outlet box, only plug in
compatible equipment into that box so that you can reduce possibility
of transients defeating the MOVs.

In my parents house, every spring the thundershowers knock out the
rectifiers in the TV. after two years and progressing through voltage
ratings up to the highest (~4Kv), I installed MOVs across the line AND
across the transformer output AND across the rectifier AND across the
output side of the logic supply. (Not across the tube supply of
course!) The cost was only about 15$, but after having the rectifier
replaced twice, and an entire main board replaced because the
transient took out most if not ALL of the IC's, I think the overkill
will save the boards. And for the last four years, there has not been
a single problem due to transients in the TV. (But transients did blow
the radio that was plugged into the SAME outlet).

This is why it is recommended that MOVs be placed in EACH item that

you wish to protect.

Peter Barada
ima!pbear!peterb

20$ of MOVs are worth more than the agrevation of blowing delicate
electrical equipment.

Most MOVs are designated both by peak current and NOMINAL voltage
These devices work for both AC and DC. (AC devices will last longer
though).

If you hooked up MOVs at the feed box for the house, it would protect
from the outside disturbances, but not inside transients.

If you want to protect logic, I recommend tranzorb devices by GS
(general semiconductor), specifically the

    1N5908

This devices charecteristics are:

    1.5Kw Peak Pulse Power dissipation @ 25 deg c
    Tclamp (0 V to BVmin) < 1 pecoseconds! (theoretical)
        (can not measure it if < 3 picoseconds)
    Forward Surge rating (1/2 cycle):
        200amps, 1/120 second @ 25 deg c
    Steady State power dissipation:
        5W @ 75 deg c, lead length 3/8 inch
    Repitition rate (duty cycle):
        .05%

It comes in a molded case, (9.4mm X 5.08mm)

Clamping voltage is 7.2 volts, and rises only slightly to ~ 8 volts @ 100v and rises slightly beyond. This is unlike MOVs that may rise to quite higher than the nominal voltage indicated.

10Kpf capacitance, reducable to 200pf by schottky diode in series, 1KA @ 7.2 V

This is only one of the devices GS makes, and this is intended for logic protection. Originally designed for MIL work to protect from nuke EMP, these devices work quite well.

for more info, write GS for a catalog:

General Semiconductor Industries, Inc.
2001 West Tenth Place
Tempe, Arizona 85281
(602) 968-3101

This is not an endorsment of mine, however, a friend does endorse them.

Update: Eavesdropping on SCA Transmissions

A few weeks ago, I posed a question about listening to

SCA transmissions on the FM commercial broadcast band. An article in _M_o_n_i_t_o_r_i_n_g__T_i_m_e_s claimed that connecting a vlf receiver to an FM broadcast receiver would permit SCA detection.

Necessity being the mother of invention, a way was found to confuse the ICOM R71A into tuning below 100 kHz1, and after receiving substantial inspiration from Will Martin, Phil Karn, and others I now can report success!

With the R71A in the FM mode, tuned to 67 kHz, I connected the ICOM's vlf antenna input through a 0.1 ufd capacitor2 to the earphone jack of a $16 General Electric AM/FM portable radio, and can now listen in on the world of SCA!

In the first few minutes of tuning around, I've heard the Physicians' Network, Muzak, commodity reports, and several data transmissions.

Thanks again for the help!

---

1. Parnass, Bob, "Trick the ICOM R71A below 100 kHz", to be published in _M_o_n_i_t_o_r_i_n_g__T_i_m_e_s_.

2. The capacitor is needed with the GE radio I used to block DC.

I suspect that the two characters you are hearing are 'RY' repeated
over and over. This is a standard test pattern idle character combination,
used by lots of wire services.

On the subject of RTTY, I'm looking for good deals on converters, and
software for a TI99 (which I have just laying around the house), if
anyone knows anything good.

Does anyone out there have a lot of experience servicing the Tempo S1 2m HT? I'm having problems with mine and, of course, the schematic in Tempo's tech manual does not give all the voltages. The symptom is that I am getting almost no audio level (intermittently it will come on).

Also, is there any mod I can make to keep the CD4059ae CMOS synthesizer chip from being blasted by static (besides being EXTRA careful?

If you can help, please e-mail to me.

Thanks in advance,
Nick WB3COR

Parallel.

> If it hooks up in parallel to the power line, why wouldn't one MOV
> work for your entire house? It seems that it would, because all the
> lines in the house are connected to together in parallel.

That would work if you expect all the transients to be developed on the wiring outside of your house. This may be a reasonable expectation in some instances. However, if you are interested in protecting againt lightning strikes nearby, there could be significant spikes induced in the wiring inside the house.

The other problem with using one MOV for the whole house is protecting the MOV's. MOV's are sort of like big zener diodes, in that above a certain voltage, they start conducting heavily, but below that voltage they don't conduct very much. Notice I said "sort of", because they don't work on the same principle as zener diodes, nor are their breakdown characteristics as sharp or as well-defined as for zeners. Anyway, the problem is this: when the voltage across the MOV reaches the breakdown voltage and it starts conducting, something has to limit the current flow or the MOV will be itself destroyed. Typically, the current is limited by the resistance and inductance in the wiring. Since the wiring coming into a house is typically much heavier than the internal wiring, it is not as effective at limiting the current into the MOV as the smaller gauge internal wiring. This means you need a bigger MOV.

Mitch Bradley

Subject: Packet radio and emergency communications

Patti Winter, N6BIS, will be writing a major article for QST on the topic of the use of packet radio in emergency communications, and she is seeking information from anyone who has had experience in this area.

If you have written an article on this subject or done emergency planning
which incorporates the use of packet radio technology, please contact
Patti at the address below or send her a copy of your article.

She would like to meet/interview anyone with such experience at the
ARRL Networking conference in San Francisco at the end of March.

Hank,

There is a hotbed of packet activity in Birmingham Alabama, led by
Jim Grifith, WA5RAX. I thinkWA4YCM might find it fruitful to
contact Jim, Jim is the head of the Navy Marine Corps MARS Hi Tech
program, and the local VHF MARS network in Birmingham is packet.
This is used as a gateway switch for the long haul MARS traffic
that uses Birmingham as a hub.

Has anyone had experiences (good or bad) in recording off the
Kenwood R2000 (or other hf receivers) using the built in timer ?

It would be nice to set the timer and record any traffic for a

specified amount of time while you are away.

The R2000 has a provision to do this, but I am not sure how
(or I should say if) it works with a regular cassette recorder.

Thanks for all the mail about my request on ACSB, it helped
clarify my understanding of it.

Pardon me if you've seen this already, but article posting
here has been buggy:
======

         EAVESDROPPING ON SUBCARRIER TRANSMISSIONS

     A few weeks ago, I posed a question about listening to
     SCA transmissions on the FM commercial broadcast band.
     An article in _M_o_n_i_t_o_r_i_n_g__T_i_m_e_s claimed that connecting
     a vlf receiver to an FM broadcast receiver   would permit
     SCA detection.

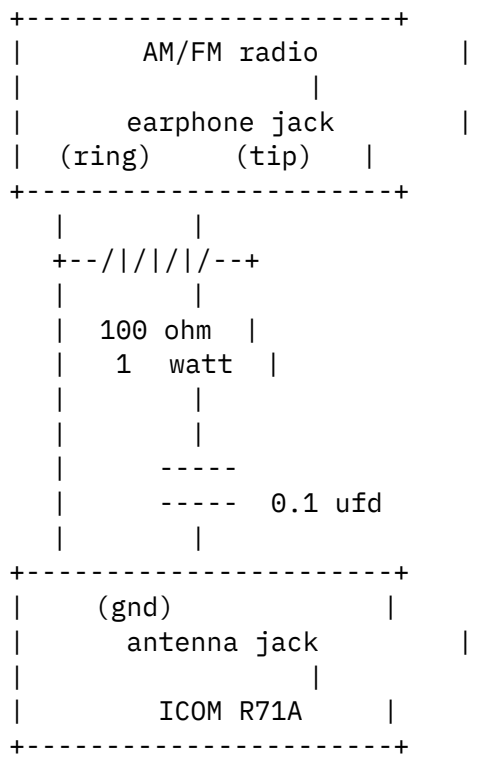
     Necessity being the mother of invention,   a way
      was
     found to   confuse   the ICOM R71A into tuning below 100

kHz1, and after receiving substantial inspiration from Will Martin, Phil Karn, and others I now can report success!

With the R71A in the FM mode, tuned to 67 kHz, I connected the ICOM's vlf antenna input through a 0.1 ufd capacitor2 to the earphone jack of a $16 General Electric AM/FM portable radio, and can now listen in on the world of SCA!

In the first few minutes of tuning around, I've heard the Physicians' Network, Muzak, commodity reports, and several data transmissions.

I built a simple SCA interface, consisting of a capacitor and resistor, into a plastic film canister.



Most activity is heard with AM/FM radio tuned to the FM broadcast band, and the R71A set to 67 kHz FM. Aside from the Muzak, commodity reporting, and the Physicians' Network, I also heard an announcer reading from _P_o_p_u_l_a_r__C_o_m_m_u_n_i_c_a_t_i_o_n_s on CRIS, the Chicago Radioland Information Service. This service carries programming of interest to the handicapped.

With the AM/FM radio tuned to the AM broadcast band, and the R71A set to 60 kHz AM, I can hear what seems to be stereo subcarriers on AM broadcast stations claiming

to transmit in AM stereo.

---

1. Parnass, Bob, "Trick the ICOM R71A below 100 kHz", to be published in _M_o_n_i_t_o_r_i_n_g__T_i_m_e_s_.

2. The capacitor is needed with the GE radio I used to block DC.

--

I have ham plates from Calif. I paid something like $25 for them the
first time. There does not appear to be a reoccuring charge each year.
Its my understanding that vanity plates have a special charage each
year, but ham plates are one time only.

In ACSB a few percent of the channel power is dedicated to sending a pilot carrier that is related to the actual carrier in some fashion out of the normal "audio" band. The receiver phase locks to this pilot tone and adjusts the BFO of the receiver to the exact frequency, eliminating the normal "Donald Duck" effect of SSB mis-tuning.

From what my roommate who owns a two-way shop says, the stuff is great in strong signal areas, but when you get into the fringes the signal deteriorates very rapidly, especially in fluttery conditions prevail.

My partner in my new company was the marketing VP for Sideband Technology who perfected the technology told me of the gawking that the Motorola folks did at the trade show they demonstrated their radio at, seems that they where playing Barbara Striesdan(sp?) through their box and it didn't sound half bad.

Motorola is like the IBM of the radio industry, whatever they invent is "real". No one belieese anything can be done 'til they commercialize it. Kinda like the recent IBM development of 'full-duplex' terminals.

My problem is that I can't get tags for my car bearing both the
fire department insignia and my call letters. I have to choose
one or the other. Even though FD tags are 4 dollars cheaper a
year I go for HAM TAGS. More indicative of who I am, but I am
always explaining to gas station attendants what they are as they
write them down on the credit slip. There are also legal reasons
why I want to keep my anonymity about being a fire fighter while
driving down the road.

Ham plates in California cost $15 initially (up from $3 before 1979), with
no yearly charge. They cost $7 to transfer them to another vehicle.
Vanity plates cost something like $25 (blue) or $30 (reflective white)
initially with a $10 yearly charge.

My friend recently purchased a 7600d (2002) identical in every way
to mine, EXCEPT that its 'normal-fine tune-ssb' 3-position switch has
only 2-POSITIONS. The SSB function is not there !! The switch appears
to be mechanically restricted to 2 positions, and does not say 'ssb'
like mine does. This set appears (by its english-arabic handbook) to
have been made for the arabs.
Why would the ssb function be left-out of their version??
Is it there electrically if the mechanical restraint is removed??

I would greatly appreciate help on this.

qst de k9eui
hr propagation forecast bulletin nr 8 from arrl headquarters
newington ct february 24, 1985
to all radio amateurs bt

the solar flux reached its february high, 78, on the 19th. it then dropped back steadily, to the months low, 72, on the 24th. the flux is expected to drop to about 70 by the end of february. a mild rise is likely in the first few days of march.

qst prediction charts covering late february and early march continue to be on the optimistic side as to maximum usable frequencies. the february qst charts are based on a solar flux of 89. those in the march issue are based on a flux of 88. experience this winter has confirmed that solar flux numbers in the high seventies or higher are needed if the 21 mhz band is to be useful for dx work on anything but the most favorable north south paths. flux values consistently in the eighties or higher are needed to do the same for 28 mhz. with the current flux readings even 14 mhz is mainly a daytime band.

low ionization density generated by such low solar activity will continue to turn our lower frequencies into long skip territory, often hampering their use for reliable communication over distances under a few hundred miles. this is bad for traffic handlers but it helps to spur interest in working for

multiband dx awards.

american sunspot numbers for february 14 to 20 were between 25
and 0 with a mean of 10.1   ar

I'm trying to interest my 10-yr old in SWL and get not just another
radio. The ones we've been looking at that have any kind of SW bands
run around $120 or so. Do you know of or have any pointers to
anything more reasonable in about the $100 range or so. (It's his
money, and I don't really want him to drain all $135 he has on
something that may turn out less than interesting to him due to lack
of features, etc.)

From: Hank Magnuski, KA6M
Date: February 25th, 1985

Subject: ARRL Networking Conference - See us at Faire Booth 833/835

The management of the 10th West Coast Computer Faire conference confirmed today that the ARRL & Pacific Packet Radio Society will have a very large 20' x 10' booth near the center of the exhibit area. We plan to have an ongoing demonstration of packet radio equipment and technology at the booth, and hope that this exhibit will be of interest to the many computer oriented hams who will be in attendance at the show.

This message is a formal request for members of the various packet radio associations to participate in the exhibition by bringing with you stacks of your newsletters, membership applications and any other material which would be appropriate. We will have this literature on display and would be pleased to help promote packet in your area.

In other developments, I have been informed that Steve Goode, K9NG, will bring his 9600 bps radio modems to the conference. This, for sure, will be the year that amateur packet radio moves to 9600.

If you haven't made your travel plans yet, do it today! The special 30-day advanced purchase discount airline tickets will expire in a few days.

Re: protecting your house from lightning carried on the
incoming power lines.
1)Most homes around here have 3 line, single phase 120/240
service. All three lines should be protected- taking 3 MOVs
or ONE three-electrode gas tube. When the gas tube is fired
(due to voltage on any pair of lines) it "shorts" all three
lines together.
2)At the entrance to the house wiring the power lines can
indeed supply lots of power and so the protection device must
be able to pass lots of current and dissipate lots of power.
Once again a gas tube fits the description.
  A company I've dealt with (through a distributor) which makes
a variety of gas tube surge protectors is TII (I don't remember
what it stands for, and I can't find my catalog.) An example of
a home lightening surge protector (from a 6 year old spec sheet):
Three wire, maximum discharge voltage: 450V@500AMP, 800V@1,000AMP
2 1/2" x 2 1/2" x 1 3/8" + 1/2" threaded nipple $21.54.

BOB,

SOUNDS LIKE A LOT OF TROUBLE JUST TO LISTEN TO SCA. I HAVE BEEN
LISTENING TO SCA FOR AROUND 8 YRS NOW. LOOK AT ONE OF THE OLDER
SIGNETICS APPLICATIONS BOOKS AND THERE IS A SLICK LITTLE CIRCUIT THAT
WILL ALLOW YOU TO DO IT WITH A 565 PHASE LOCK LOOP CHIP. THE 565 DOES
THE DETECTION AT 67 KHZ WHICH MEANS THAT YOU DON'T NEED TWO RECEIVERS!!.
JUST TUNE THE FM RECEIVER AND THE PLL DOES ITS THING!!

REGARDS,

VAL L. ERWIN
W5PUT

Hi, Frank!

Here's a few thoughts on the SWL-radio-for-$100 idea:

a) Unfortunately, you just missed the pre-Christmas deal on the closeout
of the Uniden CR-2021 portable digital-keypad receiver, one of the biggest
bargains in the SW world for some time. There is a ghost of a chance that
you could find one, or maybe someone who got one for a gift and doesn't
want it would let it go for the sale price, which was $90-$110, depending
on the dealer. Ther were 4000 of these, I understand, and they went all
over the country, so chances of locating one are slim...

b) Pick up a library or newsstand copy of the latest ham radio magazines
(QST, 73, CQ, ham radio) and check for local hamfests coming in your
area. You can often find good general-coverage tube receivers there for
well under $100; you are expected to haggle, but you have no guarantee
or assurance the thing will work when you get it home and plug it in.
If you do any electronic repair work, this is the most economic route.
If you have to pay a local shop to fix a flea-market deal, it won't pay.

c) Check if any local ham-equipment or two-way radio dealer(s) have
bulletin boards in their stores. You will often see "for-sale" ads
from people with receivers for sale, and you can post your own "wanted"
ads. At least in this case, you can usually go to the seller's house
and try out the receiver before buying it.

d) Those same dealers might have trade-in or consignment used gear to sell. You can sometimes get a warranty via this route, but you'll pay more than flea-market or individual-seller prices.

e) Mail-order discount houses -- Check the ads in Popular Communications for SWL-emphasis; the same firms advertise in the ham magazines but list few receivers. Also check the Sunday New York Times (I think mainly the "Arts & Entertainment" section) for the New York discount electronics & photo gear houses. The prices advertised there are lower than in their catalogs or magazine ads, usually. There are some Sony & Panasonic models you'll find at all these sources, and some Kenwood, Toshiba, & other brand portables that will be in the Popular Communications ads but not in the discounters' ads. The main problem with the items you'll find for $100 and under is that most of them make performance compromises for the sake of small size, and technology compromises to get down to under $100. For $160 or so, you can get high technology portables like the Sony 7600D/2002, so the $80-range portables tend to be rather mediocre slide-rule-dial-type machines with little to recommend them.

What would I do? I'd try to get a good old tube-type communications receiver. I used to have a Hallicrafters SX-96, which I regret ever letting go (traded it in on a fancier receiver I never liked as well). If you can find a working model, you should be able to get it for less than $100. (They do tend to hold their value -- I paid $100 for my used SX-96 and traded it in for $100 credit a decade later! -- at least in dollar amounts as inflation cheapens the dollar, so I would think $100 is still a fair price, even now, 15 years farther down the line.)

These older tube receivers still have good reputations; many DXers prefer older Hammarlunds or Collins models to the newer, fancier, and more expensive models. Only recently have some specifications, like dynamic range, on the newer solid-state receivers been improved to equal the specs of the better older receivers. They are physically large and steady, and have a better tuning "feel" than most newer smaller types. If you get one, I recommend that you stock up on spare tubes from some of the low-cost surplus or mail-order dealers, since many types of tubes are no longer in production.

If you get one, be careful to make sure that it is a general-coverage receiver; many came in ham-band-only models, the difference being mainly one digit of the model number. Most of the general-coverage models had ham-band-calibrated bandspreads, which can confuse the casual glance.

Regards,
Will

> callsign plates on because he is too destitute to pay "vanity" rates for them,
> the public interest will be poorly served indeed!

C'mon, let's get serious. If we really want to claim that we should
have cut-rate vanity plates because "we can perform a communications
service", then CB'ers are even more entitled.

While it is only a minority of hams who actually have mobile equipment,
the vast majority of CB'ers are mobile-only.

In addition you'll find a great number of radio-dispatched business
vehicles on the road. Should they get cut-rate plates too?

And how about cars equipped with mobile telephones? Especially the
new cellular phones which provide a much more flexible and convenient
communications service than ham radio? Should you get a cut-rate
vanity plate if you have a mobile phone?

The days of hams having a monopoly on civilian mobile radio equipment
are long gone. The days of hams regularly "serving the public interest"
never existed to begin with. Let's face reality, and behave like the
"responsible citizens" that we like to think we are. ----- Doug, N7FB

x
            LOSS OF ICOM BACKUP BATTERY FORCES
                REPROGRAMMING OF RAM

     A friend from Wheaton (MD) asked me to post this war-
     ning:

            If you own an ICOM R71,   751, 271, or   471,
            don't disconnect the lithium battery on the
            memory board!

All these models use a common $17 memory plug-in board which contains 2 IC's (one a Japanese 2114 RAM) and a lithium battery.

This fellow wanted to experiment with the memory circuit, so he disconnected the battery in order to install a socket for the RAM.

His radio didn't work when he reconnected everything, and a call to ICOM confirmed that the RAM contains the microcode which gives each model radio its own personality. His board is on its way back to ICOM for reprogramming, which can't be done at the dealer's.

For ICOM owners, this means that when the lithium battery runs down (7 year life), the memory board must be sent in for reprogramming.

For those interested in the R71A service manual, a disappointing note: the manual does not contain schematics for the speech synthesizer or IR remote control.

This fellow is contemplating using his home computer, which uses 2114s to determine the contents of the ICOM
RAM, and is looking for other suggestions. It would be useful to modify the contents of the RAM to permit out of band reception.

According to the editor of Car and Driver - a rare beast among Z-D
magazines: they make a profit - what is really going on here is that
Ziff-Davis itself is going under. They have sold a number of
magazines, C/D included, to CBS, and are in the process of
selling/closing nearly everything else. So if you want a refund from
a defunct magazine, I suggest you move quickly.

More info on this is included in editor David E. Davis's Driver's Seat
column, February 1985 issue of Car and Driver.

Last week the staff of Computers and Electronics (nee Popular Electronics)
was called together to announce its closing. Thus, another Ziff-Davis
magazine, like Microsystems, PC Jr., has folded. Can Creative Computing
be far behind?

This information was given to me by a former Z-D employee, now with CBS.

This is a bit sad. Popular Electronics had its first issue in
October 1954. Its competition was and still is Radio Electronics.
Together, but separately, these two magazines started the micro
computer revolution with the introduction of build it yourself kits.
Radio Electronics came out with a micro based on the Intel 8008
and Popular Electronics was soon to follow with a microcomputer
based on the new Intel 8080 called the Altair. The Altair used
what is now called the S-100 bus (the Zenith Z-100 is a direct
descendant). In November 1982 Popular Electronics was renamed
Computers & Electronics. The magazine, in my opinion, currently
has degraded down to the trash level (the level of Popular Computing)
from what was once a great magazine - this is the sad part. A message
on INFO-MICRO states that the publisher announced that it will bite
the dust soon. 31 years....

It is indeed sad. Popular Electronics led me and many of my friends toward technology before Sputnik made it a national obsession, and for many years helped me keep a scratching toehold on the advancing state-of-the-art in hardware as an important part of earning my living in software. The name change to Computers and Electronics, and the content changes that accompanied it, were an obvious step off the cliff, and it's now hit bottom. At 30 years, my PE subscription was second only to ASF.

This Ziff person is really building up a debt; in addition to the mags, he zapped a number of friends of mine who'd worked very hard to put together a large, highly-accessable data base system for him.

Another (expensive) alternative to triac dimmers: use an autotransformer. They're physically too large to install in an outlet box, and require ventilation air in the higher current ratings, but they do work.

I have one controlling the reading lamp over my bed, and the computer graphics lab here uses incandescent lamps on autotransformers as dimmers. In both these cases, the reason was avoiding audio noise, not RFI. Incandescent lamps driven by the waveform put out by a triac dimmer "buzz" audibly; with the autotransformer the only sound is the (very quiet) hum of the transformer itself.

As a side benefit, the lamp can be taken smoothly right down to zero light output, something that just doesn't work with the triac dimmers.

When picking an appropriate size of autotransformer dimmer, remember
that incandescent lamps are not constant-impedance devices - use
the transformer ratings intended for constant-current loads.

<gulp>
Agreed, RFI from el-cheapo solid state light dimmers can be a serious problem.
I had one in my living room, but took it out when it started spitting QRM into
my hi-fi system.
The problem is that the SCR or triac does the dimming by "chopping" the AC
sine wave part way through the cycle. Since incandescent lamps have a
fairly long time lag - chopping a 60Hz wave reduces the RMS voltage level
causing the bulb to dim without *too* much flicker. But this chopped wave
has a rather high harmonic content and that's what's causing the RFI.
You can try the standard RFI suppression tricks. Make sure the light dimmer
is in a metal box (even if your local electrical code allows nonmetallic
outlet boxes) and that the box is solidly grounded (again, the National
Electrical Code requires metallic outlet boxes to be grounded). Also try
ferrite beads on all the dimmer leads.
However, I'd suggest getting away from the solid state dimmer altogether and
using one of the following alternatives:
1) Wire the lights on several switches - this is probably the least expensive
approach, although it only gives you a few levels of light - you can get three
levels of light from two switches by putting 1/3 of the lamps on one and 2/3 on
the other.
2) Use an autotransformer for dimming the lights. Admittedly, autotransformers
aren't cheap, and they are too large to fit in a standard box, but their output
is a sine wave and they don't produce RFI. Also, autotransformers can be used
to dim fluorescent lamps as well as incandescent ones. (You do need special
dimmer ballasts in the fluorescent fixtures and the temperature should stay
above 55-60 degrees F when the lamps are dimmed). Keep in mind the National
Electrical Code requirements that autotransformers be grounded and that the
grounded circuit conductor (the neutral or white wire) be common to both
input and output circuits). Also, an autotransformer is NOT an isolating

device, so consider the secondary circuit to be part of the AC line.

First of all, thanks to those of you who took the time to respond to my query.
Lots of good information came out of it, which I will forward to the net:

1) The Sept. 1983 QST has an article on page 56 that describes the (then new)
    Novice test procedure. It lists the FCC's novice test bank of 200 ques-
    tions from PR Bulletin 1035-A. It also invites people to send an s.a.s.e.
    to ARRL and ask for their "ARRL Novice Test". It is a "multiple-choice
    version of the question pool along with complete instructions to examiners
    and applicants". I sent for that yesterday.

2) Apparently, some time ago, some hard-working person typed in the entire
    question pool, with correct answers only (not mult choice) and sent it to
    the net. This was forwarded to me. Its handy being machine-readable.

3) A single multiple-choice test, with an answer key was provided. This solved
    my immediate need of giving the test to an applicant.

One of the questions prompted a fair amount of controversy and friendly rivalry
among the people I showed it to. Let's see how the net votes:

        2D-7.7 If an SWR bridge reading is higher at 3700 kHz than it is
                at 3750 kHz, what does this indicate about the antenna?

              A. The antenna is too long
              B. The antenna is too short
              C. The antenna is too high
              D. The antenna is too low

Again, my thanks to those who provided responses.

John Burgess, N7DCQ

AMEN, BROTHER!!!

Maybe it's time to start pushing the ARRL to do something about the various local laws which try to restrict radio reception. As I understand it, all it would take is for the Feds to officially claim pre-emption in this area. Is there a lawyer in the house who could comment on this?

>From earlier conversations I have had with FCC personnel, it is the FCC's 'feeling' that the burden of privacy rests with the sender of information -- they should scramble if they don't want it overheard. (I know a lot of vendors of scrambling equipment who agree, too!)

Having a monitor that receives the local police freqs would certainly make life easier for the professional thief. I suspect that this law was passed mainly to give the police reasonable cause to stop and question suspicious cars that have antennas on them. If they happen to notice some crowbars and assorted loot in the back seat then so much the better. Then even having a permit won't help them.

The exclusion of hams makes life a lot easier for both the hams and the local police who don't have to deal with all that paperwork. It will be interesting to see how this law is enforced because if the police can stop anyone with an antenna (But officer! Its only a AM radio antenna) then the concept of no searches without reasonable cause goes out the window.

I suppose that this law could be used to harrass innocent people if they managed to irritate the local police, but then so could most other laws. Thats why we have judges and they can throw things out of court.Lets find out first what you need to do to get a permit. Does this law attempt to prevent people from having radios or simply try and keep track of who does?

qst de k9eui
hr arrl bulletin nr 4 from arrl headquarters
newington, ct january 26, 1975
to all radio amateurs

the arrl board of directors met in hartford, ct on january 24 and 25. highlights of the actions taken follow.

one of the first orders of business was the approval of the arrl budget for 1985. there were several amendments made to the articles of association and bylaws of the league. among them were a change in the title of general manager to executive vice president. the committee structure of the board of directors was also changed so that the standing committees are now the administration of finance, membership services, publications, and volunteer resources committees. there will also continue to be an executive committee.

the following arrl directors were elected to one year terms on the executive committee, w0fir, w3abc, ve3cdm, and w6zm. k1zz resigned from the office of secretary, and w1ued was elected in his place.

k1zz was elected to the office of executive vice president. the following directors were elected to new terms as directors of the arrl foundation, k1ki and n2yl. the following were also elected to new terms as foundation directors, wa1svy and w6gc.

the arrl president announced the membership of the administration and finance committee, w9prn as chairman, k0to as alternate chairman, w5ch and k1llu, and w8rc as secretary. the membership services committee, w7qgp as chairman, w5edz as alternate chairman, k1ki as secretary, and w6ejj. publications committee, w4rh as chairman, w4ug as alternate chairman, wa6wzo, and k0ga as secretary. volunteer resources committee, w4oyi as chairman, k0pgm as alternate chairman, n2yl and n5tc as secretary.

the board approved a revised 23 cm band plan submitted to the board by the vuac and vrac. adjustments were made in the arrl 33 cm band plan with respect to canadian amateurs. a policy was adopted to pursue acquiring authority for arrl to assist fcc in area of call sign issuance. advisory committee structure will be studied, and in the interim each will be budgeted up to 500 dollars. changes were made with regard to the field organization appointment dealing with rfi. all resources available are to be mobilized to release the 24 mhz band to u.s. amateur use. the board will share the results of the 40 meter phone band survey as of the count on april 1, 1985. membership input will be sought regarding the possible

modification of the arrl band plan for 160 meters.

qsl bureaus were commended. the vuac is tasked to reexamine the arrl band plan for 420 to 450 mhz. the study of dxcc country status criteria is to continue. the dxac was directed to reconsider the possible dxcc country status of 4u1vic taking into account recent u.s. state department communication that the u.s. is about to enter into a thigd party agreement with the vienna international centre. there is to be a study of whether to adopt a policy to pay authors of articles printed in league publications, particularly qst. there will be a study of the feasibility of a station appointment for the purpose of administering some arrl awards. a nominal fee for dxcc membership pins has been authorized. the complete minutes will appear in qst ar

hr arrl bulletin nr 5 from arrl headquarters
newington, ct january 28, 1985
to all radio amateurs

the fcc issued several notices of proposed rulemaking last friday. subjects addressed include new uhf frequencies and mode l satellite operation for the amateur service, repeater coordination, and the waiting period for retaking vec administered amateur exams.

the commission also issued two orders which affect the vec program. one order deletes the requirement for volunteer examiners to list their mailing address, license class, and

license expiration date in section 2 of the form 610. the other order deletes the requirement that the fcc be notified 30 days in advance of volunteer examiner test sessions.

further details of these rulemaking actions will be made available as they are received ar

qst de k9eui
hr propagation forecast bulletin nr 4 from arrl headquarters newington ct january 28, 1985
to all radio amateurs bt

after almost no significant movement in more than 4 months, the solar flux rose from 70 on january 11 to 91 on the 20th. the biggest surprise was a single day jump from 76 to 91, but there was also a single day peak, and the flux was back to 72 by the 27th. effects of the higher flux were most pronounced on 21 mhz. this band had been marginal or worse through much of the fall and winter, but almost worldwide dx came back for a few days. there were minor dx flurries on 28 mhz, with only north south paths working, and those only briefly.

by the 27th the flux was back down to 72. the game was over, at least for the present. as predicted last week, geomagnetic activity was erratically high, making for unstable prohagation in the higher latitudes. things improved after the 25th, but by then solar activity was back down to near quiet sun levels. for this week, propagation will be mildly unstable, improving to fair to good on january 31, and through about february 4. several fair to poor days will follow, the worst coming around february 6 and 7. generally more stable conditions, but with low muf, are due february 10 through 17.

american sunspot numbers for january 17 to 23 were between 16
and 43 with a mean of 28.3 ar

>I am planning to finish my basement. I would like to use a combination
>of fluorescent lights and incandescent lights ....

When I worked for an electrician installing lighting systems awhile back,
almost every book and most experts agreed that mixing the two types in
one room produced ill effects. I guess you could play games with choosing
complimentary bulb types, but if you ever have been in a room where both
types are used, you would see what I mean....they just don't work well with
each other..

You might want to consider track lighting instead of the tubes. It's a
bit more expensive (ok, ALOT more expensive), but I think it would give
your room a better atmosphere.

SCarter

Poor question, not enough information! Which frequency is the operating
frequency? Without making assumptions, either A or B could be right. (By
making MAJOR assumptions, D could be right. Could C ever be correct?)

Good Morning Keith,

This is another new name for the info-hams list; hrand@office-8. He is Hank Rand, K2RF, also here at ARDC. Can you please add him to the good guys.

Thanx,
Sid

Re: Novice test question 2D-7.7:

"One of the questions prompted a fair amount of controversy and friendly rivalry among the people I showed it to. Let's see how the net votes:

2D-7.7 If an SWR bridge reading is higher at 3700 kHz than it is at 3750 kHz, what does this indicate about the antenna?

A. The antenna is too long
B. The antenna is too short
C. The antenna is too high
D. The antenna is too low"

Technical questions normally should not be settled by voting. There should be a correct answer. However, in this case, there seems to be no way to decide, nor is there any assurance that ANY of the above answers is correct.

There is not enough information given. What is the desired operating frequency? Is it 3750 KHz, for example? And what is the VSWR at the desired operating frequency? Is it 1.000000 to 1 at 3750? If the answers to these two questions are "Yes!" then I would say that none of the above answers is correct.

However, since the question is addressed to presumably-aspiring Novices, who may be presumed to want to operate over the entire Novice band of 3700 to 3750 KHz, maybe we can adduce some "common sense" facts and circumscribe the problem enough to get a practical answer. Let's assume that coverage of the Novice band is desired, and that the antenna is a half-wave center-fed type with a feed line whose characteristic impedance closely matches the feedpoint impedance of the antenna at resonance. Then the SWR should be close to 1 to 1 at resonance. As one tunes away from resonance, it should increase as a function of the ratio of actual measurement frequency to resonant frequency.

It would be desirable to put resonance somewhere near 3725 KHz and have nearly equal VSWR at 3700 and 3750. Now the question begins to make more sense. If the VSWR is higher at 3700 than at 3750, then the resonant point must be higher than the midpoint, 3725. It might be close to 3750, in which case the VSWR would be very good at the high end of the Novice band but poorer at the low end. Or, resonance might even be above the Novice band, in which case the VSWR might be very poor over the whole Novice band, and not get down to a reasonable value for operating without a tuner until we get up to 3900 or 4000 KHz.

In either case, we can see that the resonance point is at too high a frequency. Using the standard formula, length = 468 / f(res), for a half-wave resonant antenna, we can see that if f(res) is too high, then length is too short. We can even calculate the correct length. It is about 125' 7". So the antenna must have been cut to less than this length by mistake. With regard to answers C. and D. above, note that this formula assumes that the antenna is far away from objects which might detune it by stray capacitance to ground. In particular, if one were to cut an antenna to 125' 7" and string it up only a few feet above ground, it might exhibit a resonance well below 3725 Hz because the stray capacitance to ground would be too high. But this would make the VSWR higher at 3750, not 3700. This is the usual case that one runs into with practical antenna installations, so probably the antenna will end up this way unless cut for a theoretical resonance higher than 3725. So answer D. can be ruled out. Stringing the antenna up too high would only tend to bring it closer to the theoretical resonant frequency. So answer C. can also be ruled out.

In summary, answer B. seems to be the correct answer, taking these practical considerations into account.

73,
John Sangster, W3IKG

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
I have just picked up a Tektronix 547 scope for nothing (yes,
that's a tube device!). I am looking for an operation/maintenance
manual for it. Does anyone know where I can get a copy? I would
be grateful if you could send any info to:

     Dick Green
     P.O. Box 277
     Etna, NH 03750

Or send me electronic mail at:

     cmi@dartmouth (CSNET)
     ...!decvax!dartvax!cmi (USENET)

Thanks in advance,

Dick Green

Re the posted question:

        2D-7.7 If an SWR bridge reading is higher at 3700 kHz than it is
                at 3750 kHz, what does this indicate about the antenna?

              A. The antenna is too long
              B. The antenna is too short
              C. The antenna is too high
              D. The antenna is too low

None of these answers are right. The correct answer is: The antenna is
exactly right.

The reason is that this Novice intends to use his Novice license long
enough to get to 13 WPM and get his General. He then intends to retire
to 75 Meter phone and ragchew forever. Therefore, he has cut the antenna
for 75 Meters and is just using it in the Novice band until he upgrades.

73,
/Rcc

>The problem is that the SCR or triac does the dimming by "chopping" the AC
>sine wave part way through the cycle.

I once designed a dimmer based upon zero-switching and digital cycle-counting.
To dim the light to 40%, only allow 40 out of 100 half-cycles to pass. This
method is easier on the triac and lamp, but takes more hardware and won't
really fit in an outlet box. A side advantage is that it is more easily
interfaced to a computer than the phase-control technique. A more serious
problem is that there is excessive flicker at very low duty cycles -- at 2%
light, a cycle is passed about once a second! Practical experience showed
levels as low as 10% (6 Hz flicker rate) were tolerable, (due to filiment,
not visual, persistance) with the typical useage range of 30% - 70% working
quite well.

Best of all, absolutely no RFI!

I am trying to restore some old (tube type) Becker Mexico
automobile radios. But, I am having trouble finding
service information. I understand there might be a
Sams Photofact for them; I just can't find what number
it is though. I did manage to get a schematic for a
Mexico B (from s/n 95000) which is correct for one

of the ones I have but, gives no information on the power
supply (power supply == umrichter) or alignment of the
unit.

```
              s/n      power supply
I have the following:
              805301        umrichter E (or F?)
                       vibrator type

              867979        ??
                       transistor supply

              956049        umrichter E
                       vibrator supply
```

If anyone can help me with any information about these units
I would be very appreciative. Or where to get parts. Or
if you have one you'd like to give away or sell that would be
nice too. I guess anything would help!

thanks,
Walt.

Other than the normal ideas of batteries, generators, and / or solar panels
which may not work to efficiently in your area, I normally end up back to old
fashioned batteries. Gell-cell or lead-acid when used in parallel fed by a
small current sensing battery charger has worked time and time again.

Basically, the batteries are always supplying power to your rig. However, a
charger working off normal house power is left connected. The batteries acting
as a filter (the AC 60Hz hum), as the charge is diminished the charger senses

it and kicks on, thereby keeping the batteries at a constant charge. Should house power fail you continue to run off the batteries without any break in service.

Other than that Good Luck....

Several people have requested the machine-readable copy of the novice test bank; rather thatn reply individually, I'll post to the net. Get ready to cool your phone lines:

P.S. Yes, it really does begin with page 2.
P.P.S. Don't ask me why; that's the way I got it.

--

Rules and Regulations

2A-1.1 What is the Amateur Radio Service?

A: A radio communication service of self-training, intercommunication, and technical investigation carried on by amateur radio operators.

2A-2.1 Who is an amateur radio operator?

A: A person holding a valid license to operate an amateur radio station issued by the Federal Communications Commission.

2A-3.1 What is an amateur radio station?

A: A station licensed in the amateur radio service embracing necessary apparatus at a particular location used for amateur radio communication.

2A-4.1 What is amateur radio-communications?

A: Non-commercial radio communication by or among amateur radio stations solely with a personal aim and without pecuniary or business interest.

2A-5.1 What is that portion of an amateur radio license that conveys operator privileges called?

A: Operator's license.

2A-6.1 What authority is derived from an amateur radio station license?

A: Authorization for a radio station in the Amateur Radio Service.

2A-7.1 What is a control operator?

A: An amateur radio operator designated by the licensee of an amateur radio station to also be responsible for the emissions from that station.

2A-7.2 What is the term used in Part 97 of the FCC Rules to define the amateur radio operator designated by the licensee of an amateur radio station to also be responsible for the emissions from that station?

A: Control operator.

2A-8.1 What is third-party traffic?

A: Amateur radio communication by or under the supervision of the control operator at an amateur radio station to another amateur radio station on behalf of anyone other than the control operator.

2A-8.2 Who is a third-party in amateur radio communications?

A: Anyone other than the control operator.

2A-9.1 What are the Novice class operator transmitting frequency privileges in

the 80 meter band?

A: 3700 to 3750 KHz

2A-9.2 What are the Novice class operator transmitting frequency privileges in the 40 meter band?

A: 7100 to 7150 KHz

2A-9.3 What are the Novice class operator transmitting frequency privileges in the 15 meter band?

A: 21100 to 21200 KHz

2A-9.4 What are the Novice class operator transmitting frequency privileges in the 10 meter band?

A: 28100 to 28200 KHz

2A-9.5 What, if any, transmitting frequency privileges are authorized to the Novice class operator besides those in the 80, 40, 15 and 10 meter bands?

A: None.

2A-9.6 In what frequency bands is a Novice class operator authorized to be the control operator of an amateur radio station?

A: 80, 40, 15, and 10 meter bands.

2A-9.7 What does the term frequency band

mean?

A: All frequencies that fall between and upper and lower frequency limit.

2A-9.8 What does the term frequency privilege mean?

A: Frequencies where operation of an amateur radio station is permitted.

2A-9.9 In what frequency band is the Novice class operator transmitting frequency privileges 3700-3750 KHz?

A: 80 meter band.

2A-9.10 In what frequency band is the Novice class operator transmitting frequency

privileges 7100-7150 KHz?

A: 40 meter band.

2A-10.1 What is the only emission authorized for use by Novice class operators?

A: A1, C.W., international morse code.

2A-10.2 What does the term A1 emission mean?

A: Sending signals by turning a transmitter on and off. Also known as on-off keying.

2A-10.3 What is the symbol for a transmission of telegraphy by on-off keying?

A: A1

2A-10.4 What does the term CW mean?

A: Continuous wave. Transmission of signals by letting a transmitter send a continuous wave or turning it off. This might be accomplished by connecting a telegraph key to the "send" control of a transmitter.

2A-10.5 What, if any, emission privileges are

authorized to the Novice class beside A1?

A: None

2A-10.6 What is the only telegraphy code a Novice class operator may use?

A: international Morse code.

2A-10.7 Which, if any, telegraphy codes may a Novice class operator use beside the international Morse code?

A: None

2A-10.8 What does the term emission mean?

A: emission refers to the type or nature of a transmitted signal.

2A-10.9 What is the term for a transmission from a radio station, as used in the FCC Rules?

A: emission

2A-10.10 What does the term emission privileges mean?

A: This refers to what emissions a station is allowed to use.

2A-11.1 Under what circumstances, if any, may the control operator cause unidentified radio-communications or signals to be transmitted from an amateur radio station?

A: None

2A-11.2 What is the meaning of the term unidentified radio-communications or signals?

A: Signals that do not use FCC approved call signs.

2A-11.3 What is the term for transmissions from an amateur radio station without the required station identification?

A: Unidentified radio-communications or signals.

2A-12.1 Under what circumstances, if any, may the control operator of an amateur radio station willfully or maliciously interfere with or cause interference to a radio-communication or signal?

A: None

2A-12.2 What is the term for transmissions from an amateur radio station which are intended by the control operator to disrupt other communications in

progress?

A: Malicious interference

2A-13.1 Under what circumstances, if any, may the control operator cause false or deceptive signals or communications to be transmitted?

A: None

2A-13.2 What is the term for a transmission from an amateur radio station of the word MAYDAY when no actual emergency has occurred?

A: False or deceptive

2A14.1 Under what circumstances, if any, may an amateur radio station be used to transmit messages for hire?

A: None

2A-14.2 Under what circumstances, if any, may the control operator be paid to transmit messages from an amateur radio station?

A: None

2A-15.1 What is one of the five principles which express the fundamental purpose for which the Rules for the Amateur Radio Service are designed?

A: Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.

2A-20.1 Call sings of amateur radio stations licensed to Novice class operators are from which call sign group?

A: Group D

2A-20.2 What is the format of a group D call sing?

A: two letters a number and three letters

2A-20.3 What are the call sign prefixes for amateur radio stations licensed by the FCC

A: AA to AM, K, N, and W

2A-20.4 In what call sign district will your amateur radio call sing be assigned?

A: That depends on your mailing address. For those in New York and New Jersey the district is number 2.

2A-21.1 With which amateur radio stations may an FCC-licensed amateur radio station communicate?

A: Only with other amateur radio stations.

2A-21.2 With which non-amateur radio stations may an FCC-licensed amateur radio station communicate?

A: None, except in an emergency.

2A-21.3 Under what circumstances may an FCC-licensed amateur radio station communicate with another amateur radio station in a foreign country?

A: Only when the each country's government permits international communications by their respective amateur operators. (this is usually the case)

2A-21.4 Under what circumstances (other than RACES operation) may an FCC-licensed amateur radio station communicate with a non-amateur radio station?

A: None, except in an emergency.

2A-21.5 What is the term used in FCC Rules to describe transmitting signals to receiving apparatus while in beacon or radio control operation?

A: One way communications.

2A-23.1 How often must an amateur radio station be identified?

A: At the beginning and end of every transmission or exchange of transmissions. Also, every 10 minutes for transmission longer than 10 minutes.

2A-23.2 How do I identify my amateur radio station communications?

A: send the letters "DE" followed by your FCC assigned call letters.

2A-23.3 Do the FCC Rules require an amateur radio station to identify at the beginning of a transmission?

A: Yes

2A-23.4 duplicate question of 2A23.1

2A-23.5 What is the FCC Rule for amateur radio station identification?

A: identification is required at the beginning and end of each transmission or exchange of transmissions. Plus, for transmissions longer than 10 minutes, identification must be given every 10 minutes.

2A-23.6 What is the least number of times an amateur radio station must transmit its station identification during a 15 minute communication?

A: 3 times: When starting, 10 minutes into the transmission, and at the end.

2A-23.7 What is the least number of times an amateur radio station must transmit its station identification during a 25 minute communication?

A: 4 times: When starting, 10 minutes into the transmission, 20 minutes into the transmission, and at the end.

2A-23.8 What is the least number of times an amateur radio station must transmit its station identification during a

35 minute communication?

A: 5 times: When starting, 10 minutes into the transmission, 20 minutes into the transmission, 30 minutes into the transmission, and at the end.

2A-23.9 What is the longest period of time during a communication that an amateur radio station does not need to transmit its station identification?

A: 10 minutes

2A-23.10 What is the least number of times an amateur radio station must identify itself during a 5 minute communication.

A: twice: at the beginning and at the end.

2A-24.1 What amount of transmitter power may an amateur radio station use?

A: The rule here has recently changed. The correct answer is 1500 Watts peak output power.

2A-24.2 What is the maximum transmitter power

input permitted to be used at an amateur radio station transmitting on frequencies available to the Novice class operator?

A: 250 Watts input. 200 Watts output.

2A-24.3 In what circuit stage in an amateur radio station transmitter is power input determined?

A: Final amplifying radio frequency stage.

2A-24.4 Which individual circuit power inputs must be included in determining the total power input to the final amplifying radio frequency stage to the antenna?

A: all radio frequency inputs

2A-25.1 Should an amateur radio operator receive an Official Notice of Violation from the FCC, how promptly should he/she respond.

A: 10 days.

2A-25.2 Should an amateur radio operator receive an Official Notice of Violation from the FCC, to whom does he/she respond?

A: To the office that originated the Notice.

2A-25.3 Should an amateur radio operator receive an Official Notice of Violation from the FCC relating to some violation that may be due to the physical or electrical characteristic of the transmitting apparatus, what information must be included in the response?

A: It should indicate what steps have or will be taken to correct the problem. If the correction will take place in the future, a scheduled date of the

correction must be included.

2A-26.1 Whom does the FCC hold responsible for the proper operation of an amateur radio station?

A: Station licensee.

2A-26.2 When must an amateur radio station have a control operator?

A: Always, unless the station is operated under automatic control.

2A-26.3 Who may be the control operator of an amateur radio station?

A: The control operator may be the station licensee, if a licensed amateur radio operator, or may be another amateur radio operator with the required class of licensee.

2B-1.1 What does the R in the RST signal report mean?

A: Readability

2B-1.2 What does the S in the RST signal report mean?

A: Strength

2B-1.3 What does the T in the RST signal report mean?

A: Tone

2B-2.1 At what telegraphy speed should a CQ message be transmitted?

A: At a speed you would like to receive a response.

2B-3.2 Why should amateur radio stations in communication with each other zero beat?

A: So that they will both transmit on the same frequency.

2B-4.1 How can on-the-air transmitter tune-up be kept as short as possible.

A: By using a dummy load antenna for initial adjustments

2B-5.1 What is the difference between the telegraphy abbreviation CQ and QRZ?

A: CQ means "anyone please reply." QRZ means "who is calling me?"

2B-5.2 What is the difference between the telegraphy abbreviation K and SK?

A: K means "go ahead." SK means "I have finished, no reply is expected."

2B-5.3.1 What is the meaning of the telegraphy abbreviation DE.

A: DE means "from."

2B-5.3.2 What is the meaning of the telegraphy abbreviation R.

A: R means "I acknowledge receipt of your message."

2B-5.3.3 What is the meaning of the telegraphy abbreviation AR.

A: AR means "end of message."

2B-5.3.4 What is the meaning of the telegraphy abbreviation 73.

A: 73 means "best regards."

2B-5.3.5 What is the meaning of the telegraphy abbreviation QRS.

A: QRS means "please send more slowly."

2B-5.3.6 What is the meaning of the telegraphy

abbreviation QTH.

A: QTH means "my location is."

2B-5.3.7 What is the meaning of the telegraphy abbreviation QSL.

A: QSL means "I acknowledge receipt of your message."

2B-5.3.8 What is the meaning of the telegraphy abbreviation QRM.

A: QRM means "I am being interfered with".

2B-5.3.9 What is the meaning of the telegraphy abbreviation QRN.

A: QRN means "I am troubled by static."

Radio Wave Propagation

2C-1.1 What type of propagation uses radio signals refracted back to earth by the ionosphere?

A: Skip propagation.

2C-1.2 What is the meaning of the term skip propagation?

A: radio waves that are refracted (or skipped) back to earth by the ionosphere.

2C-1.3 What is the area of weak signals between the ranges of ground waves and the first-hop called?

A: skip zone.

2C-1.4 What is the meaning of the term skip zone?

A: It is the area of weak signals between the ranges of ground waves and the first-hop.

2C-1.5 What does the term skip mean?

A: signals that are bounced off the ionosphere back to earth

2C-1.6 What type of radio wave propagation makes it possible for amateur radio stations to communicate long

distances?

A: skip propagation

2C-2.1 What type of propagation involves radio signals that travel along the ground?

A: ground wave

2C-2.2 What is the meaning of the term ground wave propagation?

A: radio signals that travel along the ground

2C-2.3 When two amateur radio station located a few miles apart are separated by a low hill blocking their line-of-sight path, daytime communications between them on 3.725 MHz is probably via what kind of propagation?

A: ground wave

2C-2.4 When compared to skip propagation, what is the usual effective range of ground wave propagation.

A: much shorter

Amateur Radio Practice

2D-1.1 How can an amateur radio station be protected against being operated by unauthorized persons?

A: Lock the room that contains the equipment.

2D-2.1 Why should all antenna and rotor cables be grounded when an amateur radio station is not in use?

A: to reduce shock hazard from lightning.

2D-2.2 How can an antenna system be protected from damage due a to nearby lightning strike?

A: By grounding the antenna system when not in use.

2D-2.3 How can an amateur radio station equipment be protected from damage due to lightning striking the electrical wiring in the building?

A: by unplugging it from the electrical outlet when not in use

2D-3.1 For proper protection from lightning strikes, what pieces of equipment should be grounded in an amateur radio station?

A: anything that can conduct electricity.

2D-3.2 What is a convenient indoor grounding point for an amateur radio station?

A: a cold water pipe.

2D-3.3 To protect against electrical shock hazards, the chassis of each equipment in an amateur radio station should be connected to what?

A: ground

2D-4.1 When working on an antenna mounted on a tower, a person doing the climbing should always wear what type of safety equipment?

A: a safety belt.

2D-4.2 For safety purposes, how high should all portions of a horizontal wire antenna be located?

A: high enough so that it won't pose a hazard to people or vehicles.

2D-4.3 What type of safety equipment should a person on the ground wear while assisting another person on an antenna tower?

A: a hard-hat.

2D-5.1 What is a likely indication that radio frequency interference to a receiver is caused by front-end overload?

A: interference is present regardless of the frequency that the receiver is tuned to.

2D-5.2 When radio frequency interference occurs to a receiver regardless of frequency, while an amateur radio station is transmitting, what is likely the problem?

A: front-end overload

2D-5.3 What type of filter should be installed on a television receiver's tuner input as the first step in preventing overload from an amateur radio station's signal?

A: a high pass filter

2D-5.4 What is meant by receiver overload?

A: the receiver hears signals that are too strong for it (these signals may be on frequencies other that what the receiver is tuned to).

2D-6.1 What is meant by harmonic radiation?

A: radiation (or transmission) of energy on frequencies that are integer multiples of the intended signal.

2D-6.2 Why is harmonic radiation by an amateur radio station undesirable?

A: causes interference

2D-6.3 A multi-band antenna connected to an improperly tuned transmitter may radiate what type of interference?

A: harmonic radiation

2D-6.4 What is the purpose of properly shielding a transmitter?

A: to prevent spurious radiation

2D-6.5 When interference is observed on only one or two channels of a TV receiver while an amateur radio station is transmitting, what is the likely problem.

A: harmonic radiation

2D-6.6 What type of filter should be installed on an amateur radio transmitter as the first step in reducing harmonic radiation?

A: low pass

2D-7.1 Why is it important to have the impedance of a transmitter final amplifier circuit match the impedance of the antenna or feedline?

A: so that SWR will be minimum

2D-7.2 What is the term for the measurement of the impedance match between a transmitter final amplifier circuit and the antenna or feedline?

A: One measurement would be standing wave ratio or SWR.

2D-7.3 What station accessory is used to measure RF power being reflected back down the feedline from the antenna to

the transmitter.

A: directional watt meter or SWR meter

2D-7.4 What station accessory is often used to measure voltage standing wave ratio?

A: SWR bridge

2D-7.5 Where should an SWR bridge be connected to indicate the impedance match of a transmitter and an antenna.

A: Either between the transmitter and the feedline or between the feedline and the antenna (latter is best).

2D-7.6 Coaxial feedlines are designed to be operated with what kind of standing wave radio?

A: low or 1:1

2D-7.7 If the SWR bridge reading is higher at 3700 KHz than at 3750 KHz, what does this indicate about the antenna?

A: It provides a better match at 3750 KHz than at 3700 KHz.

2D-7.8 If the SWR bridge reading is lower at

3700 KHz than at 3750 kHz, what does this indicate about the antenna?

A: It provides a better match at 3700 KHz than at 3750 KHz.

2D-8.1 What kind of SWR meter reading may indicate poor electrical contact between parts of an antenna system?

A: unusually high (more than 4:1)

2D-8.2 High SWR readings measured from a half-wave dipole antenna being fed by coaxial cable can be lowered by doing what to the antenna?

A: changing its length

Electrical Principles

2E-1.1 Electrons will flow in a copper wire when its two ends are connected to the poles of what kind of source?

A: a current or voltage source

2E-1.2 The pressure in a water pipe is comparable to what force in an electrical circuit?

A: voltage

2E-2.1 What are the two polarities of a voltage?

A: positive and negative

2E-2.2 What type of current changes direction over and over again in a cyclical manner?

A: alternating current

2E-2.3 What is a type of electrical current called that does not periodically reverse direction?

A: direct current

2E-3.1 List at least four good electrical insulating materials.

A: glass, plastic, rubber, mica

2E-3.2 List at least three good electrical conductors.

A: silver, gold, aluminum

2E-3.3 What is the term for the lowest voltage which will cause current in an insulator?

A: break-down voltage

2E-4.1 What is the term for a failure in an electrical circuit that causes excessively high current?

A: a short circuit

2E-4.2 What is the term for an electrical circuit in which there can be no current flow?

A: an open circuit

2E-5.1 When a voltage is applied to a circuit causing an electrical current to flow, what is consumed?

A: Power or Energy

2E-6.1 What is the approximate length, in meters, of a radio wave having a frequency of 3.725 MHz?

A: 300/3.725 = 80.5 meters

2E-6.2 What is the relationship between

frequency and wavelength?

A: inversely proportional OR speed = wavelength times frequency.

2E-6.3 What is the approximate length, in meters, of a radio wave having a frequency of 21.120 MHz?

A: 300/21.120 = 14.2 meters

2E-7.1 Which are higher: radio frequencies or audio frequencies?

A: radio

2E-7.2 Is 3,500,000 Hertz a radio frequency or an audio frequency?

A: radio

2E-7.3 Radio frequencies are considered to be those above what frequency?

A: 30 KHz

2E-8.1 Are audio frequencies higher or lower than radio frequencies?

A: lower

2E-8.2 Audio frequencies are considered to

be those below what frequency?

A: 30 KHz

2E-8.3 what frequency range is 2500 Hertz: audio or radio?

A: audio

2E-9.1 What is the unit of electromotive force?

A: Volt

2E-10.1 What is the unit of electrical current?

A: Ampere

2E-11.1 What is the unit of electrical power?

A: Watt

2E-12.1 What is Hertz the unit measurement of?

A: frequency

2E-12.2 What is another popular term for Hertz?

A: cycles-per-second

2E-13.1 A frequency of 40,000 Hertz is equal to how many kilohertz?

A: 40 KHz

2E-13.2 A current of 20 millionths of an ampere is equal to how many

microamperes.

A: 20 microamperes

2E-13.3 A current of 2000 milliamperes is equivalent to how many amperes?

A: 2 amperes

2E-13.4 What do the prefixes mega and centi mean?

A: Mega is million and Centi is hundredth.

2E-13.5 What do the prefixes micro and pico mean?

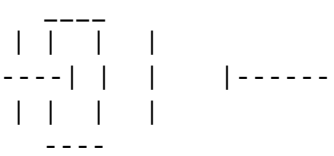
A: Micro is millionths and pico is million-millionths.

2F-1.1 What is the general relationship between the thickness of a quartz crystal and its fundamental operating frequency?

A: As the crystal becomes thinner and thinner, the frequency becomes higher and higher.

2F-1.2 What is the schematic symbol for a quartz crystal?

A:



2F-1.3 What chief advantage does a crystal controlled transmitter have over one controlled by a variable frequency oscillator?

A: Crystal controlled will be much more stable in frequency

2F-2.1 What two internal components of a D'Arsonval meter interact to cause the indicating needle to move when current flow through the meter?

A: A permanent magnet and an electro-magnet

2F-2.2 What does a voltmeter measure?

A: voltage

2F-3.1 Draw the schematic diagram of a triode vacuum tube and label the elements.

A:

2F-3.2 Draw the schematic symbol for a tetrode vacuum tube and label the elements.

A:

2F-3.3 What was one of the earliest uses of a two-element vacuum tube?

A: rectifier or diode to convert AC to DC

2F-4.1 What device should be included in electronic equipment to protect it from damage resulting from a short

circuit?

A: a fuse

Practical Circuits

2G-1.1 Draw a block diagram for a simple crystal controlled transmitter.

A:

2G-1.2 Draw a block diagram for a simple transmitter having a variable frequency oscillator.

A:

2G-2.1 Draw a block diagram for a simple superheterodyne receiver capable of receiving A1 telegraphy radio signals.

A:

2G-3.1 Draw a block diagram for a portion of an amateur radio station including a transmitter, an antenna feedline, an antenna and an SWR bridge.

A:

2G-3.2 Draw a block diagram for a portion of an amateur radio station including a transmitter, a receiver, a T-R switch, an

antenna feedline and an antenna.

A:

2G-3.3 Draw a block diagram for a portion of an amateur radio station including a transmitter, an antenna tuner, an antenna feedline and an antenna.

A:

2G-3.4 Draw a block diagram for a portion of an amateur radio station including a transmitter, telegraphy key, antenna

feedline and antenna.

A:

2G-3.5 Draw a block diagram for a portion of an amateur radio station showing how two different antennas and a dummy antenna can be switched to the same transmitter.

A:

2G-3.6 Draw a block diagram for a portion of amateur radio station including a transmitter, an SWR meter, an antenna tuner, an antenna feedline and an antenna.

A:

2G-3.7 Draw a block diagram for a typical Novice station including a transmitter, a receiver, an antenna feedline, an antenna, a T-R switch, grounding provisions and a telegraph

key.

A:

Signals and Emissions

2H-1.1 An interrupted carrier wave is considered to be which type of emission?

A: Continuous wave or CW

2H-2.1 What does the term backwave mean?

A: backwave is a signal heard in a receiver after a transmitter is de-energized. This is caused when a transmitter continues to output energy when the receiver becomes activated

2H-2.2 What is a possible cause of backwave.

A: improper transmit-receive switching circuitry operation.

2H-3.1 What does the term key clicks mean?

A: clicks generated by a transmitter when the key is opened or closed.

2H-3.2 How can key clicks be eliminated?

A: With a key click filter

2H-4.1 What does the term chirp mean?

A: Frequency shift of a transmitter when the key is closed.

2H-4.2 What can be done to a telegraph transmitter's power supply to avoid chirp.

A: ensure that it has good voltage regulation

2H-5.1 What is a common cause of superimposed hum?

A: poor transmitter power supply filtering.

2H-6.1 A signal received on 28.160 MHz is the 4th harmonic of what fundamental frequency?

A: 28.160/4 = 7.040 MHz

2H-7. Spurious emissions from a transmitter may be caused by what problem in the power amplifier stage?

A: over-drive or improper neutralization.

Antennas and Feedlines

2I-1.1 What is the approximate total length in feet of a half-wave dipole antenna

cut for 3725 KHz?

A: (300/3.725) * 3.28 *(1/2) = 132 ft.

2I-1.2 What is the approximate total length in feet of a half-wave dipole antenna cut for 7125 KHz?

A: (300/7.125) * 3.28 *(1/2) = 61.9 ft.

2I-1.3 What is the approximate total length in feet of a half-wave dipole antenna cut for 21125 KHz?

A: (300/21.125) * 3.28 * (1/2) = 23.3 ft.

2I-1.4 What is the approximate total length in feet of a half-wave dipole antenna cut for 28150 KHz?

A: (300/28.150) * 3.28 * (1/2) = 17.5 ft.

2I-1.5 How is the approximate total length in feet of a half-wave dipole antenna calculated?

A: determine the total length of a one wave and divide by 2.

2I-2.1 What is the approximate total length in feet of a quarter-wave vertical antenna adjusted to resonate at 3725

KHz?

A: (300/3.725) * 3.28 *(1/4) = 66 ft.

2I-2.2 What is the approximate total length in feet of a quarter-wave vertical antenna adjusted to resonate at 7125 KHz?

A: (300/7.125) * 3.28 *(1/4) = 34.5 ft.

2I-2.3 What is the approximate total length in feet of a quarter-wave vertical antenna adjusted to resonate at 21125 KHz?

A: (300/21.125) * 3.28 * (1/4) = 11.6 ft.

2I-2.4 What is the approximate total length in feet of a quarter-wave vertical antenna adjusted to resonate at 28250 KHz?

A: (300/28.250) * 3.28 * (1/4) = 8.7 ft.

2I-2.5 When a vertical antenna is lengthened, what happens to its resonant frequency?

A: As with most common antennas, when they are lengthened, the resonant frequency decreases.

2I-3.1 What is coaxial cable.

A: cable constructed of a center

conductor encased in insulation, which is then covered by an outer conducting shield and weatherproof jacket.

2I-3.2 What kind of antenna feedline is constructed of a center conductor encased in insulation, which is then covered by an outer conducting shield and weatherproof jacket?

A: coaxial cable.

2I-3.3 What are some advantages in using coaxial cable as an antenna feedline?

A: can be located near other metal objects, can be buried.

2I-3.4 What commonly available antenna feedline can be buried directly in the ground for some distance without adverse effects?

A: coaxial cable

2I-3.5 When an antenna feedline must be located near grounded metal objects, which commonly available feedline should be used?

A: coaxial cable

2I-4.1 What is parallel conductor feedline?

A: feedline constructed of two conductors maintained a uniform distance apart by insulated spreaders.

2I-4.2 Can an amateur radio station use TV antenna "twin lead" as a feedline?

A: Yes

2I-4.3 What are some advantages in using a parallel conductor feedline?

A: very low loss, can be home-made.

2I-4.4 What are some disadvantages in using a parallel conductor feedline?

A: can't be buried or used near grounded metal objects.

2I-4.5 What kind of antenna feedline is constructed of two conductors maintained a uniform distance apart by insulated spreaders?

A: parallel conductor feedline

LISTEN TO 850 MHZ ON A 400 MHZ RECEIVER

Bob Parnass, AJ9S

A recent article1 described the technique of using "multiple injection frequencies," and introduced an equation which permits listening in the 512 - 657 MHz range (UHF television channels 21 through 44) using radios designed to receive 402 - 512 MHz.

This article introduces another equation, permitting 851 - 1158 MHz reception using a Radio Shack PRO30 scanner designed to receive 380 - 512 MHz. The equation may be applicable to other scanners.

Using this equation, my Radio Shack PRO30 scanner receives the Illinois State Police District 15 (855.4875) when the radio is programmed for 381.9250 MHz. Mr. James Cavanagh, of Palatine, Illinois, reports that his PRO30 receives the Palatine Police (856.7125 MHz) when programmed for 382.4500 MHz.

The Method

In the equations that follow, all frequencies are in units

of Megahertz. To listen on a frequency Y between 851 and 1158 MHz, tune your radio to:

$$\frac{3(Y) + 10(IF)}{7}$$

where IF is the intermediate frequency of the receiver.

Conversely, if you hear a strange signal when your UHF radio is tuned to X MHz, you may be simultaneously listening to the frequency of:

$$\frac{7(X) - 10(IF)}{3}$$

When using this technique to receive microwave signals on a scanner, the signal may be very weak, because a typical scanner radio is not nearly as sensitive in the 851 - 1158 MHz range as it is on the frequencies for which it was designed.

Technical Explanation

What's happening is that an injection signal with multiple constituent frequencies is being being fed to the mixer stage.

To hear the Palatine Police signal (856.7125 MHz), the PRO30 is set to 382.45 MHz. At this setting, the local oscillator/tripler chain is injecting a signal into the mixer stage at:

$$382.450 - 10.7 = 371.750 \text{ MHz.}$$

This 371.750 MHz signal is the output of a frequency tripler, whose input frequency is:

$$371.750 / 3 = 123.9167 \text{ MHz.}$$

But, in addition to this 3rd harmonic, there is a 7th harmonic component present:

$$7\ (123.9167) = 867.4167 \text{ MHz,}$$

which when mixed with the police signal on 856.7125 MHz, produces a 10.7 MHz IF:

867.4167 - 856.7125
= 10.7042 MHz

One may think of this 7th harmonic as being the sum of the 3rd harmonic, the signal the circuit was designed to produce, and the unexpected 4th harmonic, described in the previous article.

Poor Sensitivity

During reception of both police transmitters described above, the signal came directly into the mixer stage through the PRO30 case, bypassing the antenna and RF amplifier stages! Tests were made using the supplied flexible antenna and an external 146 MHz antenna. The connection of either antenna made no difference in signal strength. Disconnecting the antenna altogether made no difference either. Apparently, the RF amplifier/antenna combination attenuated the microwave signals more than the plastic case, which is painted with a conductive substance.

Don't expect very good range on these frequencies. In both cases, the microwave transmitters were within a few blocks of the scanner and line of sight.

A Regency HX1000 scanner (IF of 21.6 MHz), was tested for microwave reception using this equation, but proved unsuccessful. Once again, readers are urged to experiment to find other frequencies to which their scanners may be receptive.

       I've heard rumors that a simple modification to the Yaesu
       FT209RH   2 meter portable will permit extended receive
       coverage   into the VHF public service band, above
    150 MHz.

       How does   one make this modification?

The following message relayed via HamNet:

 #: 26740   Sub-topic 4 - TRN & Freq Coord.
Sb: TSARC SUSPENDS...
    01-Feb-85 20:25:54

Fm: NORM W2JUP 74055,140
To: ALL

At 12:01 AM this morning, February 1st, TSARC (Tri-State Amateur Repeater Council) temporarily suspended their repeater frequency coordinating activities for the next nine months....

At an emergency meeting called by TSARC president Steve Mendlesohn, WA2DHF, TSARC executive board directors heard excerpts from the contents of a new FCC NPRM (Notice of Proposed Rulemaking) that hits the streets and becomes effective today.

The FCC's NPRM addresses the subject of repeater frequency coordination, and calls for comments and opinions on proposed rulemaking that seeks to create a volunteer national "umbrella-type" coordination agency, similar to the NARTB, NABR, and other industry-based organizations of class. The "umbrella" agency would assist the activities of regional coordination councils on a nationwide basis, and hold a national database of all amateur repeaters. The same agency would establish and publish rules of procedures and technical standards for the coordination of new amateur repeaters.

As part of the NPRM, the FCC's Enforcement Bureau requested a nation-wide nine-month suspension of repeater coordination, as a measure needed to gain the time required for gathering comment, acquiring an updated and validated national repeater coordination database, and setting up the mechanisms for accomplishing the tasks.

In addition to the establishment of a national coordination scheme, the NPRM would change the wording of the Commission's Rules in Part 97.85(h) to codify and assign responsibility for the solution of repeater interference problems.

What this means in plain English: no new repeaters will be coordinated in the 25 CMSAs (Consolidated Metropolitan Statistical Areas) for at least nine months. The local frequency coordination councils will have to suspend coordinations pending the new rulemaking.

I bought a Kenwood R-600 for my 12 year old son and I for some SWL'ing
while we are studying for our novice licenses. I'm pleased with the
performance of the unit for the price of $350. It is selective enough
on SSB to separate strong adjacent signals on the 20M ham bands, and the
it has a narrow and wide selection on AM. The digital readout is great
for cruising through the ham and SW bands. There is a 30 position band
switch and each range covers 1 MHz. I only have two minor
complaints: there are a few "birdies" in some obscure places,
and the tuning is a little fast for accurate adjustment on SSB
stations. The selectivity is probably inadequate for serious CW work.
I think it's a great little receiver to start with and will probably
keep it when we graduate to a ham transceiver.

Jim Larsen

2D-7.7 If an SWR bridge reading is higher at 3700 kHz than it is

at 3750 kHz, what does this indicate about the antenna?

A. The antenna is too long
B. The antenna is too short
C. The antenna is too high
D. The antenna is too low

The correct answer is certainly D. There is not enough information here to decide whether the antenna is too long or too short, and unless the antenna blew down in the last storm, it is never high enough off the ground.

<gulp>
In most cases, the metal ears on a grounded receptacle (wall outlet) are NOT adequate to provide an equipment grounding conductor between the receptacle and the box.
The National Electrical Code (and most local codes) specifically forbids using the screws that hold a receptacle to the box for grounding purposes, unless UL (or other recognized testing laboratory) has specifically listed (approved) the receptacle for this purpose. Approved receptacles will have the letters 'FS' stamped on them, next to the UL logo, and they have a metallic springlike strip that "bites into" the threads on the screw, insuring a good electrical connection. Otherwise, it is likely that the support screws may provide a good support but a poor electrical contact for the grounding conductor.
If the receptacle is not of the 'FS' type, the Code requires a bonding jumper (a short piece of bare or green insulated wire - at least #14 for most residential general purpose 15 or 20 amp circuits) to bond the receptacle to a metallic box.
The Code requires that metallic boxes be grounded. This is accomplished by connecting them to the conduit (if conduit is used for wiring), the armor of armored (BX) cable, or to the ground wire of non-metallic cable (including type UF). Non-metallic boxes (which can only be used with non-metallic cable)

(and are not permitted by some local codes) need not be grounded, so you connect the ground terminal of the receptacle to the ground wire of the non-metallic cable.
The Code also requires that metal cover plates be grounded, and this is accomplished by the screw that connects the plate to the receptacle.
The reason receptacles are furnished with plaster ears is that in some places, the box is set back from the wall surface (which I regard as bad practice and would raise %^*%^ with any electrician who worked for me that I caught doing it) and the ears allow the receptacle to be set flush with the wall.
They are detachable, and often have to be detached (you break them off with a pair of pliers) to fit in some places, including some surface-mount cover plates.
By the way, the same grounding rules apply to surface mount boxes as well as the flush ones we've been talking about. The cover can only be used to ground the receptacle to the box IF it is specifically approved for the purpose (this is a new provision in the 1984 version of the National Electrical Code). Otherwise, a bonding jumper must be used.

I went to the local police station and asked for a permit for a mobile scanner. The lieutenant I spoke to said that their policy was to NOT issue a permit unless I was affiliated with the local first aid squad or fire company. I guess that its easier to get a hand gun permit than one for a mobile scanner!

Differences Between SWLs and Hams

Here is an interesting passage from Bennett and Helms' "The Complete Shortwave Listener's Handbook - 2nd Edition":

> "The average person nowadays,though, seems to have a built-in bit of knowledge that, to him, means that anyone with a shortwave radio of any kind is automatically a ham radio operator. This is one of the most erroneous impressions that I have ever run up against....."
>
> "Oftentimes the average person, when encountering an SWL, will ask the SWL why he doesn't get a license and actually get on the air for two-way contacts. For the SWL to reply that he doesn't want to might give the impression that he's too good for that sort of thing; for the SWL to say that he can't would leave a strong impression with the average person that he (the SWL) is too dumb to get a license. Both impressions are totally incorrect. In my own 30 years of being a ham radio operator, I have had the opportunity of meeting large numbers of SWLs, and I know for a positive fact that the great majority of them prefer to simply listen, rather than engage in on-the-air communications. Like the baseball fan who'd rather watch than play, radio is a spectator sport to the SWL."
>
> "Admittedly, there are many SWLs who cannot get a

license, but it usually is not due to any lack of ability...."

"...the average SWL is perfectly content to be a listener, and believe me, some of them are real addicts! The SWL, more often than not, continues to be actively engaged in the hobby and many of them eventually go on to the ham radio portion of the hobby. Conversely, I know of a number of ham radio operators who, for various reasons of their own, have elected to let their ham radio licenses lapse, after which they once again become active SWLs. In most cases, it was learned that they found a preference for the one-way aspect of the hobby. Experience has also proven that many ham radio operators continue to be active SWLs. This fact is confirmed by the considerable number of ham radio operators who, through the years, have reported on shortwave station reception to my columns and to the shortwave stations themselves in the form of reception reports."

Hank Bennett is well known in SWL circles. He was has been licensed as W2PNA since 1939. For over 30 years, he has been editor of the shortwave department of the Newark News Radio Club. If you don't remember reading his monthly SWL column in the old Popular Electronics (RIP - ed.), you can read his columns in Monitoring Times.

To: All packet radio stations
From: Hank Magnuski, KA6M
Date: February 4th, 1985

Subject: Fourth ARRL Networking Conference - Preliminary Information

The Fourth ARRL Computer Networking Conference will be in San Francisco this year on March 30th, 1985. The conference, co-sponsored by the American Radio Relay League and the Pacific Packet Radio Society, will be held in conjunction with the Tenth West Coast Computer Faire, which runs from March 30th through April 2nd at San Francisco's new Moscone Convention Center. The tremendous growth and interest in packet radio terminals, equipment, networks and applications promises to make this conference one of the largest and best attended of the conferences given so far. Here is some preliminary information you will need to have to attend this conference:

Location -- The Networking Conference and all activities of the Faire will be held in Moscone Center in downtown San Francisco. To attend the Conference you will need an entrance ticket to the Faire. All Faire visitors may attend the ARRL Conference at no additional charge. All sessions are open to the public, and persons with no previous knowledge of packet radio systems and procedures are welcome to sit in and learn what they can about this new area of personal computer networking.

Dates -- The Conference will be held all day Saturday, March 30th. The Faire runs from March 30th through April 2nd.

Times -- The Faire hours for sessions and exhibits are 10:00 a.m. to 6:00 p.m. every day. The Conference sessions will run all day Saturday, from 10:00 to 6:00. An exhibit booth demonstrating packet radio equipment and operation will be sponsored by the Pacific Packet Radio Society, and will be open all four days of the Faire.

Tickets -- On-site registration for four days is $20. On-site registration for one day is $12. Pre-registration for four days is $15. Through special arrangements with the Faire and the ARRL, a special pre-registration fee of $20 will purchase a four day ticket to the Faire and a complete set of the ARRL Conference Proceedings. Send a check for $20 and a self-addressed stamped envelope to H. Magnuski at the address listed below. Any checks received after March 16th cannot be guaranteed the special rate. Make the check payable to H. Magnuski.

Conference Proceedings -- The ARRL Computer Networking Conference papers have been a primary source of information on developments in amateur packet radio and digital communications between personal computers. The Proceedings will be for sale at the Faire for $10, and may be obtained from the ARRL by mail thereafter. They are included in the special pre-registration package mentioned above. The deadline for submitting papers to the Proceedings is March 1st, 1985. Contact Paul Rinaldo, ARRL, 225 Main Street, Newington, CT 06111 (203-666-1541) for author's kits or other questions on submitting a presentation.

Faire Events -- The West Coast Computer Faire has been the premier trade show in the development of the microcomputer industry. This tenth anniversary session promises to be jam-packed with sessions and exhibits on personal computing. Hundreds of leading manufacturers have signed up for the Faire, and there will be sessions and seminars on almost every aspect of personal computing.

Conference Events -- Times and places for all the networking conference events have not been finalized. Here is a preliminary outline of activities:

March 29th - 9:00 to Midnite - Network Management meeting at the Front Page Bar, 20 Anne Street, SF. Everyone is welcome. This will be a test of how late the East Coast packeteers can stay up when beers >= 2.

March 30th - 10:00 - A Packet Radio Primer Session by Pete Eaton, WB9FLW.
11:00 - Applications of Packet Radio Panel Session
Sponsored by Andy Cromarty, N6JLJ.
12:00 - Lunch break. Location to be announced later.
1:00 - Technical Papers on packet radio and digital communications. Presentations from the Proceedings.
6:00 - End of technical sessions
8:00 - Conference dinner. Location and price to be announced.

March 31st - 10:00 - Meeting of the ARRL Digital Communications Committee
Location to be announced.

Housing -- Bill Stevens has reserved a block of rooms for visiting packeteers at the Hotel Union Square, 114 Powell Street, San Francisco, CA 94102. Telephone is 415-397-3000. This hotel is three blocks from Moscone Center, and is one of the least expensive hotels suitable for conference attendees. Contact me immediately if you know you are coming and wish to reserve a room through Bill. Rates start at $60 for one double bed in a small room (the hotel management said this room is so small they only rent it to Europeans.) $65 will get you a small room with two twins. $70 rents a larger room with one double bed. To get to the hotel, take the Airporter Bus from SFO (approx. $6.00) to the downtown terminal. The Hotel is two blocks away, and you can walk or take a cab. A shuttle bus to the airport stops at the Hotel. Bill has arranged for rates somewhat less than those listed above.

For those of you with more money, the Faire has made special arrangements with four hotels in SF during the conference:

Hotel Meridien, 50 3rd Street, San Francisco, CA 94103. 415-974-6400
This is a new 700 room 36 story hotel with a French accent. Only two blocks from Moscone, the special rates start at $75 for a single, and $95 for a double. Parking is $11 per night.

Sheraton Palace, Market & New Montgomery, SF. 415-392-8600
This is the Faire Headquarters hotel, two blocks from Moscone. Rates are $95 single, $110 double.

St. Francis, Powell & Geary, SF. 415-397-7000

About four blocks from Moscone, the special rates range from $95 for a single and $105 for a double.

Holiday Inn - Civic Center, 50 8th Street, SF. 415-626-6103
This hotel is quite far from the convention, and is in a crummy neighborhood. Rates are $68 for a single, $78 for a double.

To obtain these special rates, you must request space in writing and your request must be received NO LATER THAN FEBRUARY 28th. The room blocks are released on that date! No phone reservations accepted. Indicate your first, second and third choices, names of all occupants, arrival and departure dates. Final confirmations will be sent to you by the hotel. Cancellations until March 14th to the address below, thereafter to the hotel. Contact the hotel for any other changes. Mail your reservation letter to

C.F. Housing Bureau
P.O. Box 5612
San Francisco, CA 94101

Faire Contacts -- Any questions about the Faire itself may be directed to Computer Faire, Inc. (A Prentice-Hall Company), 611 Veterans Boulevard, Redwood City, CA 94063. Telephone is 415-364-4294.

Coordination Frequencies -- There will be packet radio activity on 145.01 and 146.58 MHz. Voice channel coordination frequencies have not yet been assigned.

Expect in about one month a revised and hopefully more final version of this information bulletin. Please give this letter the widest possible distribution.

The members of the Pacific Packet Radio Society look forward to your visit, and sincerely hope you will have a pleasant stay in San Francisco.

73, Hank

Be careful!! If repeater coordintation is suspended, then 220 and maybe
even parts of other bands could become sitting ducks for attacks by
other requesters for spectrum. I suggest that at least some "unofficial
coordination" continue to show continued growth of amateur use of our
frequencies.

While doing some unofficial "hacking" in the INFO-MODEM7 directory
(I am a registered participant), I came across the file hams.archiv.txt
and being a ham myself, I FTPed it out of curiosity. Lo and behold,
ham did mean amateur radio. I am a new user to ARPANET, not new to data
processing
 and have been a ham (WA4YCM) since 1976. What are the requirements
to join the info-hams network ? Need instructions on it's use, etc.

I am also concerned about just holding off on ANY new repeaters for 9
whole months, in light of the recent attacks on 220 mhz by the land
mobile industry and others.

I guess one question is, Are the repeater coordinators formally
handling this band as well as 2 meters?

In the long run (if 220 lasts that long), though, I think the national
level planning will help us out by taking measures to prevent the
repeater interference problems on a more global basis that the
regional councils have been able to do.

Even if this will suspend NEW 220 mhz repeaters for now, we can take
more positive measures than sitting here and complaining. How about
USING WHAT WE HAVE OUT THERE NOW? How about putting more packet
repeaters out there, since they do not need to be formally
coordinated? How about going out and getting a 220 rig, or using the
ones we have and getting active on this band?

The premise in the band takeover plans is that they are not getting
used. Lets get out there and prove them wrong!

qst de k9eui
hr propagation forecast bulletin nr 5 from arrl headquarters

newington ct february 4, 1985
to all radio amateurs bt

though the solar flux peaked at 91 on january 19, the factor more relevant to the propagation picture was the january average of only 76. it is also worth noting that there were 17 days in january when the solar flux was 72 or more, these being close to the minimum possible value at this time of year.

february began on a somewhat more promising note, with the flux back up to 76, and some indications that it may go higher. any solar developments capable of bringing about major propagation changes will be reported in special bulletins as soon as possible after they are observed.

geomagnetic activity was fairly low last week, making for improved high latitude propagation on 21 mhz and lower frequencies. higher k and a indices are expected february 5 through 8, making for poor east west propagation on the higher dx frequencies . transequatorial circuits may actually improve under these conditions. auroral propagation on 50 and 144 mhz is likely february 6 to 8, mainly in our more northerly areas and in adjacent canadian provinces. auroral effects usually peak in the early evening hours, but may last through the night. watch for wwv k indices of 3 or higher and for their predictions of geomagnetic storms. auroras often follow one to three days after major solar flares, also reported in wwv propagation bulletins heard at 18 minutes after each hour and changed 8 times daily.

american sunspot numbers for january 24 to 30 were between 25 and 0 with a mean of 5.1 ar

hr arrl bulletin nr 6 from arrl headquarters
newington ct january 31, 1985
to all radio amateurs bt

fcc has issued a notice of proposed rulemaking affecting the vec program. responding to petitions requesting that the waiting period for retaking a failed amateur examination be changed, fcc proposes to eliminate the waiting period entirely, and to allow vecs to decide on a waiting period for their examinations based on their own administrative requirements. the nprm also proposes to require public notice of volunteer examination sessions only if the sessions are conducted for five or more candidates. the nprm is designated docket 85 21. comments are due by march 7, 1985, reply comments are due by march 22, 1985. complete details on the nprm appear in the latest arrl letter. copies of the nprm are available from hq. for a large s.a.s.e. with 37 cents postage ar

hr arrl bulletin nr 7 from arrl headquarters
newington ct january 31, 1985
to all radio amateurs bt

fcc has issued a notice of proposed rulemaking concerning repeater coordination. the nprm is designated docket 85 22, and proposes to add the definitions of a coordinated repeater, frequency coordinator, and harmful interference to part 97, and to define the responsibility for resolving repeater to repeater interference. fcc seeks comments from amateurs concerning whether an amateur operator should be required to seek

frequency coordination for a new repeater in a metropolitan area, and comments as to whether fcc should recognize a single national frequency coordinator for the amateur service. comments are due by july 1, 1985, and reply comments are due by september 30, 1985. until fcc takes further action on this docket, there is a moratorium on new repeater operation in metropolitan areas (see arrl 9). complete details appear in the latest arrl letter. copies of the nprm are available from hq. for a large s.a.s.e. with 54 cents postage ar

qst de k9eui
hr arrl bulletin nr 8 from arrl headquarters
newington ct february 1, 1985,
to all radio amateurs bt

fcc has released a notice of proposed rulemaking concerning frequency allocations for the amateur service. the nprm is designated pr docket 85 23. the nprm proposes to bring the microwave spectrum allocation sections of part 97 into line with the frequency allocations made at warc 79 for the amateur service. the docket also proposes to list the frequencies 1900 to 2000 khz separately from 1800 to 1900 khz, so that part 97 of the rules will be in harmony with part 2, where the segments are already listed separately. the docket points out that some frequencies are shared by different services in different itu regions, in order to protect everyone, including the amateur service, from interference. the docket seeks to clarify amateur status on some bands above 450 mhz, and to add new microwavd frequencies to the amateur service and amateur satellite service, including some frequencies in the 1.2 ghz band for mode l satellite operation. comments are due by march 11, 1985, and reply comments are due by march 26, 1985. details

will appear in the arrl letter and qst ar

This is (to date) the best (in my opinion) explanation of the antenna-length
question:

I vote for
     (forgot which letter) The antenna is too short.

According to the question, as you decrease the wavelength of the signal
coming from the transmitter and keep the antenna length constant, you come
closer to a proper match. So the antenna is the correct fraction of a
shorter wavelength than the one corresponding to 3700 KHz, which is to
say that the antenna is too short for 3700 KHz. It might be right for
(say) 3740 KHz, you don't know whether the null is higher or lower than
3750.

I agree with what Bill Mitchel said regarding grounding of outlets.
I was just looking in one of those "do it yourself" wiring books
(from Sears, or whatever) and it shows a ground wire from the
ground screw on the outlet to the box, in the case of conduit,
and the conduit serving as the safety ground conductor. The counduits
and the main box are connected to the neutral bus bar via a "bonding screw"
in the box. An earth ground also connects to this neutral bus.
In the case where non-metallic cable is used (like where I live

Romex is permitted) the safety ground conductor from the box
is provided by a third conductor in the cable,.
The outlet and box are still connected to each other via a wire.
I do have one question, however, regarding house wiring.
I have been told it is not good practice, or may not be "code"
in some cases, to solder connections. WHY???????
I always twist the wires in a box tightly with pliers, then
solder them and install the wire nuts. There have been many
times that I have pulled an outlet or switch out of a box and
the wires have easily pulled out of the wire nut. I can't
think of a better connection than a soldered one.

Mobile home dwellers should check into their wiring! I have
had 2 "homes on wheels" and in both cases there were serious
wiring problems. In both cases, the problem involved a hot
wire that was not cut off after being wrapped around a wall
switch screw. the wire protruded thru some holes in the rear of
the box and was touching the outer shell of the mobile home.
(Both units used stranded wire and the boxes were plastic.
There was at least a 20 year age difference between them and
one was a Shasta camper, while the older one was a 30 foot job).
The older home had just 2 fuses and only the one side was
switched with the main switch. Unfortunately, when I bought it
it was connected to the pole so that the switch and fuses were
in the neutral side! I really got shook when the water heater
element broke down to frame ground and stayed lit like a flash
bulb. Turning off the main switch did not kill the water heater!!!
After disconnecting disconnecting the power via the outside
twist-lock connector, I reversed the wires at the pole.
Then I reconnected the trailer connector. When I grabbed the
door handle to go back inside, I got knocked on my ass!
Then I pulled out all the switches and receptacles and found
all the "tails" on the screws. Too bad it did not have a
safety ground in the power cable.

x
I've heard rumors that a simple modification to the Yaesu
FT209RH 2 meter portable will permit extended receive
coverage into the VHF public service band, above
150 MHz.

How does one make this modification?

NJ Hams, don't buy that mobile scanner yet!
As of February 5, 1985, State Assembly ll 2393
and the companion Senate bill are both in
committee and no action is scheduled on either.
Reportedly Governor Kean has been briefed
and he is sympathetic, but he may never see the bill(s).
I can't imagine that a revision to help hams
is very high on the action priority list
in spite of some hard lobblying by some hams
with contacts in the state government.
It's been tried before. This time the fellows were
more knowledgable on how to go about it,
but don't anyone hold their breath.

     Recently I inherited a homebrew 80 -10 meter amplifier
from a local ham who has become inactive. The amplifier is
really a work of art and was easy to get back on the air.
The amplifier suffers from one problem. One of the 4-400A
tubes is defective and requires replacement. New 4-400A's
run typically in the $188 price range (one reason why you
don't see contruction articles using this tube any more).
Any suggestions for alternate sources for this tube?

While we're on the subject of test questions, the most memorable one
I've encountered was on my very first (Novice) test in 1971.

The question was to the effect "what precautions should be taken with
high voltage power supplies?". The obviously correct answer was "the
use of bleeder resistors". In the same list, however, was "Double indemnity
life insurance." Imagine! The FCC with a sense of humor. It really
made my day.

This discussion about what ought to be a trivial (to us hams, anyway)
question brings up an important point. If it becomes obvious that a given
question is ambiguous, how do we go about having it removed from the list?
Can a person who has taken a test appeal such questions?

Phil

Send a certified letter asking for the permit. Then they have to deny in
writing. This will usually get almost any permit you need. Remember,
your dealing with little mentalities trying to be big and important. Be
friendly but firm, and ask for everything negative in writing.

Does anyone know of a good RTTY decoder program for the Commodore 64?
I have seen MICROLOG advertised in some magazines as a good program for the
Shortwave Listener. Has anybody used itor know of another good software product
that does RTTY/morse decoding?

Walt:

1. Well, Sonny Boy, when I was yer age, we usta fixem with a wet finger
   and a Volt-Ohmmeter! A schematic was considered cheating!

2. However, in my old age, I have become more decrepit, and, as I also
   have some similar old units, I would be most grateful if you could
   let me know when you obtain manuals etc. I can be reached at
   jhs at mitre-bedford.ARPA   or at (617) 271-7423 (work) / 235-8753 (home)
   or at

        John H. Sangster
        The MITRE Corporation - K203
        P. O. Box 208
        Bedford, MA 01730

   If you are really desperate to figure out how to fix a Becker Mexico
   radio, please get in touch and I will be glad to try to help, as I
   want to fix mine also, and anything I learn helping you will be worth
   the effort.

3. It would have been more helpful, by the way, if you had included some
   more information such as your phone number or address - I was unable to
   figure out a return address for you other than this broadcast to the net.

                              -John S.

I have a Heathkit SW 7800 Communications receiver that sells for $300+
Covers .5 to 30 MHZ.. for more info just look at any current Heath catalog.

It is in perfect condition, and is only a few months old.. I will
let it go for best offer... try me..!! you might be suprised..!!

x
New Radio Shack PRO-55 Scanner

Radio Shack is replacing its lowest priced crystal scanner, the 8 channel, 3 band PRO-54 with a new model: the PRO-55.

The PRO-55 has the same frequency coverage, but has 10 channels and is built into a wood grain plastic cabinet of similar profile.

I would be very interested in picking up international broadcasts
in Esperanto (the "world interlanguage"). I hear that Radio Peking broadcasts
Esperanto about once a week, and I understand that there are quite a lot
of regular broadcasts from other countries. Does anyone know of any?
It might sound like Spanish or Italian to a non-Esperantist.

For more information on Esperanto itself, contact me or read net.nlang.
I have a short lisp program which will do a crude word for word translation
into "English".

Thanks!

I just got my Heathkit catalog and described within is such a device.

Does anybody out there have any experience with it, and to receive news
service broadcasts, does it require the optional filter elements?

This report may be of interest to those who scan the VHF bands.
Reference is made to digital voice scrambling and federal radio
assignments.

 ;Subject: CTR: spectrum resource assessment in the 162-174 mhz frequency band.
 ;Organization: National Telecommunications and Information
 ;

```
 ;
 ;              Order number: PB84-210244
 ;Title: SPECTRUM RESOURCE ASSESSMENT IN THE 162-174 MHZ FREQUENCY BAND.
 ;       Technical rept., Flynn, F. P. & Moran, W. M.
 ;       National Telecommunications and Information Administration, Annapolis,
 ;       MD.
 ;       Feb 84, 78p
 ;
 ;       This report is a spectrum resource assessment of the 162-174 MHz band.
 ;       Included is information on allocation, frequency assignments and agency
 ;       equipment usage, along with the results of agency interviews. Present
 ;       spectrum management techniques and associated problems were considered
 ;       in this report. This band contained 35,275 assignments, as of January
 ;       1982, which is approximately one-quarter of all the frequency
 ;       assignments in the GMF.
```

Employees of AT&T Bell Laboratories may obtain a photocopy of
this report by typing the command:

```
         /usr/lbin/library -1 PB84-210244
```

and answering the questions which ask for your name and payroll
account number.

```

Well, I am still trying to decide on how to mount a 2m antenna
onto my new Celica. I am now considering a trunk mount. I have
talked to a few people and they say performance is ok, but almost

all the trunk mounts leak a bit. Is there a secret to mounting these
things or is it luck? Anyone have any recommendations as to which
2m mobile antenna they like? I am eyeing a few 5/8 wave antennas
right now. I know I know, a roof mount is the best, but I cringe at drilling
holes.....

                ThMilo   anks,

I noticed a couple of problems with my last posting.
The subject line should have read:
"SWL utility broadcasts" not "y broadcasts"

Also, the frequency for WGU20 is 0.1800 not 0.1850.

My brother wants me to find out about RF Grounding and Shielding.
He saw (or heard about) a way to achieve excellent grounding by
anchoring a long flat sheet of copper (20 ft. by 6 in.) to a concrete
floor, and using it as the ground. He wants the nitty-gritty details.

He mentioned a Sperry-Rand publication called "Facility Planning" as a
possible reference, but he didn't know where to look for something like
that. My brother doesn't mind digging for himself, so names of books
or other publications and their sources would be useful, too.

This topic may be too broad, so he threw out a couple of terms that may (to some of you) narrow the scope so that it can be answered quickly.

    Common Mode Current Loop

    Copper Mass Sheeting

I don't know much about grounding or about ham radio, but I'll forward whatever you tell me to him.

Summary:

If you are considering a trunk mount, I assume that you have the coupe version of the Celica, and not the hatchback. You may want to consider a hole-mount type antenna on the trunk lid. It is not as likely to leak, and would probably work better than the trunk lid mount, having a better ground plane. I'd encourage you to put a quarter wave or 5/8 on the roof. I put one on my 1981 Celica, and it only took about 30 minutes. If you'd like the gory details of how I did mine, just ask.

BTW, I'd go with Larson antennas; they may cost more, but its worth it. I have a Larson NMO mount on my car, with a quarter wave whip for around town. I can swap the 5/8 on when I'm on a trip and want better performence.

The publication you mentioned is a facility planning and installation guide
for Sperry's 1100 Series of mainframe computer systems. You'd probably want
to find one for their 1100/80 or 1100/90 mainframe. The idea is that all of
the equipment cabinets are grounded to this system of copper sheets, which
give you a low impedence ground between the components.

I don't know if you can get one of these out of Sperry or not; most of it
deals with the mechanics of installing the ground grid, and not the theory.
I can briefly summarize the installation procedure if you like, having

installed 4 or 5 of these suckers.

Images on Regency MX5000 Scanner

Ed Sirovy (IL-004)
Chicago Chapter Moderator
Radio Communications Monitoring Association

The Regency MX5000 with its 750 MHz IF has images after all. Subtract the second harmonic of the transmit fre-
quency from 750 and there is the image! The second har-
monic itself will be heard only for some high-power FM-TV stations and then weakly if at all .... but take any sta-
tion between 100 and 275 MHz double it (200 - 550), sub-
tract it from 750 and you get an image at 550 down to 200 MHz.

Take a UHF-TV station at 550, double it to 1100 and

sub-
tract 750. You get 350 but will find no image as the
front end does not pass anything above 550.

If this were the MX7000 version, passing everything up to
1200 MHz, images would show up all over the place. Maybe
this is why we haven't seen the MX7000. The MX5000
schematic one of our members got a hold of showed the
extra circuitry for the extened range [rumor is that
Regency has given up on the MX7000 due to this very prob-
lem, and is going to offer the MX4000 instead, which
won't cover beyond 950 MHz - Bob Parnass].

Please note we are not getting a harmonic of the injec-
tion frequency, but of the frequency transmitted and
received!

December 18, 1984
Season's Greetings!

ATTENTION GLB DIGIPEATER USERS

If you are using a GLB PK-1 primarily as a digipeater, you should immediately get a software update from GLB. Software prior to Version 3.5 will not digipeat multiple frames with multiple digipeaters. If a GLB PK-1 is specified as part of a multirepeater path, only the first frame in any transmission will be repeated. This can exponentially increase the traffic on a channel where a PK-1 is a wide-coverage digipeater.

To get your software updated to Version 3.5, send a $10 deposit (or your current PROMs) to GLB. When you receive your new PROMs, send the old ones to GLB and you will get your deposit back.

This is an important problem, and should not be ignored by GLB users. The GLB address is

GLB Electronics
1952 Clinton St.
Buffalo, NY 14206.

From GLB.

MORE FROM GLB

In Gateway issue 8, we reported that GLB electronics, makers of the PK-1 TNC, were at work on the PK-2. Ed Jackson, an engineer with GLB, was able to confirm that preliminary engineering work is being done on the PK-2, but that it is primarily a "commercial TNC." More important for the radio amateur is GLB's development of the PK-R, an integrated VHF radio and TNC. On the RF end of the PK-R is a 25-watt crystal-controlled, highly stable FM rig. The packet equipment is a PK-1 TNC. For repeater operation, you simply connect the PK-R to a 12-V supply and an antenna, hit the reset button and you're on the air. For home-station use the rig has an RS-232C connector that goes to a terminal or computer. The PK-R is ready for type-acceptance tests, so look for it on the market before long.

Mr. Jackson also reports that a 200-Hz shift modification for the PK-1 is almost complete. This, along with an existing 300-bit/s modification will allow PK-1 users to join the growing number of HF packet users.

Ed.

TWO-METER BAND PLANNING

In several metropolitan areas, the amount of packet-radio traffic has exceeded the capacity of a single 1200-baud channel. On the east coast, the channel that is full is 145.01 MHz, and one of the most-asked questions is "what frequency do we go to next?" This question has no simple answer.

Ultimately, packet radio will move up to and above 220 MHz. When intercity "backbone" links are running on 220 MHz, the congestion on 2 meters will be eased. However, even when the network backbone is in place and experienced packet operators are moving to higher transmission speeds on higher frequencies, local traffic and "entry-level" packet operation will be on 2 meters.

So, the question remains: What frequency do we go to next? Some people on EASTNET have proposed a 20-kHz channel spacing, using 145.010, 145.030, 145.050, 145.070 and 145.090 MHz. Albert Hamilton, AG1F, Chairman of the New England Spectrum Management Committee points out that "Any rig produced in the last 6 years is perfectly capable of operating on a 15-kHz spacing without undue problems. While there are some real pieces of junk operating on 145.010 MHz now, that is no reason to give up sensible spacing." Using a 15-kHz spacing would provide six channels between 145.000 and 145.100 MHz -- one more channel than could be provided with 20-kHz spacing. We may need this extra channel in a few years.

If packet activity in your area is beginning to move away from a single 2-meter frequency, consider the arguments for a 15-kHz

spacing. If you have any comments on this topic, address them to Gateway and

    Albert W. Hamilton, AG1F
    Chairman
    New England Spectrum Management Committee
    54 Hathaway Ave.
    Beverly, MA 01915.

    Ed.

RTTY-TO-PACKET GATEWAYS

Albert Hamilton, AG1F, who made the above suggestions concerning band planning, is also interested in working on a RTTY-to-packet gateway. Ideally, such a gateway would operate in real-time, allowing the RTTY user and the packet user to have a proper contact without knowing what mode the other operator was using. An alternative to this scheme would be to have a bulletin-board system that could be accessed by both packet and RTTY stations. Since there are already many stations equipped for Baudot RTTY, packet-to-RTTY gateways could bring interested amateurs in contact with packet radio while increasing the utility of packet networks for traffic handling.

If you have undertaken a packet-to-RTTY project, send the details to Mr. Hamilton and Gateway.

    From AG1F.

PACKET IN PENNSYLVANIA

Gary Hoffmann, AK3P, sends us a summary of packet activity in central Pennsylvania. Gary got his TAPR TNC in June, and was the first station on the air in the Harrisburg, PA area. Shortly after that, Bob Warrington, WB3FQL, and Tim Shingara, WB3EYB, were also in operation. Tim supplied a link to WB4APR near Balitmore, and the group gained access to EASTNET.

In October, Gary installed a wide-coverage digipeater above Harrisburg in the building of the Central Pennsylvania Repeater Association. The digipeater, running under the call WA3KXG, is in operation 24 hours per day, on 145.01 MHz. From its 1400-foot elevation, WA3KXG provides a reliable link into Baltimore, Washington, and Virginia, via WB4APR and W3VD. A link into New Jersey has been established through WB3FYL and W2FPY.

There are presently about 5 stations on packet in the Harrisburg area, all using TAPR TNCs. Gary hopes that activity will increase in the near future, with links established into

Scranton, PA and New York state.

Another item from Pennsylvania: Neil Sablatzky, WA2WIM, in Edinboro, PA (near Erie) is interested in becoming active on packet. His problem is that no one else in his area is interested. He would like to help link Northwest Pennsylvania with the eastern and southern parts of the state. He would also like to establish some contacts into the Buffalo, NY area. Neil would like to hear from anyone near Erie who is working on packet networking. He can be reached on the WB3USH repeater on 146.76 MHz, where he will be listening on packet when his TAPR TNC arrives. You can write him at:

201 Granada Drive
Edinboro, PA 16412.

From KC2WZ and AK3P

MIDWEST NETWORKING

The packet-radio network that has grown up around central Iowa has finally reached the Iowa-Minnesota border. Lyle Monson, W0FQ, is active from Spirit Lake, IA.

Lyle wants to know what frequencies are being used in southern Minnesota, and is looking for some active stations to hold schedules with. He will be able to connect to the rest of the Iowa packet network via W0ZVY, the wide-coverage digipeater in Guthrie Center, IA.

The Central Iowa Technical Society (CITS) is planning a 220-MHz intercity network. They are looking for a station around Mason City, IA to extend this backbone to the north.

From W0RPK.

MT. BEACON DIGIPEATER

The gaps in EASTNET are beginning to be filled in. The addition of the WB2KMY digipeater on Mt. Beacon, NY will help to tie both Boston, MA and Newington, CT into the southern portion of the network.

The Mt. Beacon digipeater, on 145.01 MHz, is the first part of an ambitious project being undertaken jointly by the Mt. Beacon Amateur Radio Club and the Putnam Emergency Amateur Repeater League (PEARL). When the project is complete, there will be two complementary digipeaters in the mountains around Poughkeepsie, NY. One of the machines will be on Mt. Beacon, a site that has good coverage to the west. The other will be on Mt. Ninham, with a clear path to the east. The two clubs will be working together to minimize interference between the two digipeaters maximize

the coverage provided by the pair.

The call used at the Mt. Beacon site is WB2KMY-1, and the call at the Mt. Ninham site will be KG1O-9. If you are located in northern New Jersey, Northeastern Pennsylvania or Western New England, check out these new facilities. (Leave reports of coverage on the WA2RKN-2 MailBox.)

If you are not in New England, there is still something of value here; packet repeaters, unlike 2-meter voice repeaters, must coexist on a single frequency. If several clubs in one area are interested in packet radio, it is important that they work as a team to provide valuable and useful coverage. Lack of cooperation can only lead to a congested local-area network.

Via WB2KMY.

WESTNET IN MONTEREY

Packet operations in Monterey, CA, have improved due to the addition of a 6-element Yagi at the K6LY digipeater site. Buzz Shaw, WA1NHP, reports that the Monterey packet operators are also looking into a site on Mt. Toro, at an elevation of 3500 feet. This would be a real improvement over the current site, which is only 110 feet above sea level. However, even at the low elevation, stations using K6LY can usually connect to Hank Magnuski, KA6M, and use his Data General computer system.

Via WA1NHP

ILLINOIS PACKET MEETING

Twenty-five people, representing networks in Central Illinois, Southern Illinois, Chicago and St. Louis, attended the December 2 meeting of the Central Illinois Packet Radio Users Society (CIPRUS). The administrative portion of the meeting resulted in a statement of the club's intent "to promote packet radio throughout Illinois by acting as a clearing house for packet information, and to work for reliable packet communication within Illinois."

After electing club officers, those present took up a discussion of packet-radio operating practices. Since packet radio is new to amateur radio, there is no body of common thought as to what constitutes "good operating procedure." In particular, there is still no agreement as to when it is appropriate to send out CQ or QST messages. Broadcasting such frames through wide-coverage digipeaters has started to significantly slow traffic on several crowded networks. However, those at the CIPRUS meeting agreed that QST packets used as propagation indicators or to carry news bulletins were reasonable. They also decided that CW

identification is not necessary and should be discouraged. [Close examination of section 97.84 of the FCC Amateur Radio Service Rules shows this to be an acceptable decision.-- Ed.] It was observed that application of common sense by packet operators would significantly reduce network congestion.

The CIPRUS meeting closed with the distribution of the the national Packet User's Directory as compiled by N9AGC and available through CIPRUS.

Via K9NG.

PACKET MAP

Paul Barnett, N0CRN, placed the following message on DRNET:

"I'm compiling information on existing amateur packet networks to use at an upcoming packet-radio demonstration. I want to be able to show a large map of North America that is sufficiently detailed to explain multiple digipeaters and show how packet-radio networking is progressing.

"I would like everyone to send me information about their local network, so that I can generate the map. Please confine the listed stations to those with wide coverage. I'm not particularly interested in the 50 stations within 25 miles of each other in a metropolitan area. What I am interested in is the stations that make up a link into another metropolitan area.

"I'd like to hear about all forms of networking: VHF (EASTNET, SOUTHNET, WESTNET), HF (particularly gateways and scheduled traffic handling operations) and OSCAR teleports.

"Confine your descriptions to reliable links, noting those that are not available 24 hours per day. Please limit information about planned links to those that will be a available by the end of the year.

"When I get the map done, I will try to reduce it to a single page and make it generally available.

Send information about your local network to
Paul Barnett, N0CRN
130 Demont Ave. East, Apt. 255
Little Canada, MN 55117

or to Gateway at the ARRL.

Via DRNET.

PACKET APPLICATIONS: WEATHER

K6AAG>QST:HIDESERT WX 1100/52/SCTRD/VIS10HZ/SSE10-
15/29.71/"Robbie"

Although running in an attended and manual mode now, the above is an example of what could become an automated service as packet radio continues to grow and rules continue to change.

For those who need help in interpretation (as I did), the above QST frame says that the weather in Southern California's high desert region at 11:00 was 52 degrees, scattered clouds, visibility 10 miles with haze, winds from the south southeast at 10-15 knots, barometer 29.71 inches. Robbie Wohosky, K6AAG, the originator of the message, is active in the California weather net on 75 meters. He currently summarizes the information gathered by this net and distributes it via RTTY. He is now looking into ways to use packet radio as well.
It is probably a safe bet that amateur-gathered weather information will be part of the data stream as regional and national digital networks take shape.

[If you have thought of any interesting applications of packet radio, please send them along to Gateway. -- Ed.]

From NK6K.

PACKET READING

Paul Newland, AD7I, points us toward IEEE's Communications Magazine, an IEEE monthly publication that features tutorial technical discussions about communications concepts and systems. (Don't confuse it with IEEE Transactions on Communications, a mathematical and theoretical journal.) The December issue of Communications Magazine contains the following articles of interest to packet-radio enthusiasts:

"Automatic-Repeat-Request Error-Control Schemes," by Shu Lin, Daniel Costello, Jr., and Michael Miller. Error detection incorporated with automatic-repeat-request (ARQ) is widely used for error control in data communications systems. [Including packet radio. -- Ed.] This method of error control is simple and provides high system reliability. If a properly chosen code is used for error detection, virtually error-free data transmission can be attained. This paper surveys various types of ARQ and hybrid ARQ schemes, and error detection using linear block codes.

"Improving on Bit Error Rate," by Virgil I. Johannes. On the semantics of the term -- its invalidity in the absence of a specified averaging period.

"Digital Signaling Techniques," by William Stallings. A

comparison of various encoding techniques with an eye to superior performance.

Also look into the November, 1984 issue of Proceedings of the IEEE. This special issue on satellite communication networks contains an article titled "Packet Switching for Mobile Earth Stations via Low Orbit Satellite Network." Remember, PACSAT is a low-orbit packet satellite.

R.F. Design magazine for November/December, 1984 contains the conclusion of a series called "RF Modems." This article addresses the design and use of frequency agile modems. Several block diagrams and schematics are presented.

The December, 1984 issue of Telecommunications is a special issue on data communications systems, and contains several articles that packet experimenters might find interesting.

Via AD7I, KA9Q, Ed.

MISSING GATEWAY

When you subscribed to Gateway, you probably subscribed for 25 issues. A few quick calculations will tell you that there should be 26 issues in a 52-month year. The missing issue is to allow me to take some time off around the New Year. Therefore, there will be no Gateway dated January 1, 1985. Look for Gateway issue 11 on January 15. I hope that you all have safe and enjoyable holidays.

Jeff Ward, K8KA

<gulpo>
Yes, you can achieve RF shielding through the use use of a ground mat, which is
a large sheet of conductive material.   However, this is only part of the
shielding system. Usually each equipment cabinet is bonded to this mat
via ONE large conductor (a heavy piece of wire), as in the Sperry Univac
computer systems described in your publication. The key idea is: put all
sensitive equipment in a grounded enclosure that surrounds it with conducting
material. Sometimes, this is done by constructing a room out of conducting
materials, like copper sheets, or by putting the equipment in metal
cabinets. Note tht all openings, like windows, must be covered with conduct-
ive screens for this to work properly. This is called a "Faraday cage".
Another important point is to avoid ground (or common mode current) loops.
These allow currents created (induced) in the shielding system to circulate
among components, creating more interference. To prevent this, only
ONE conductor must be used between each equipment cabinet and the ground mat.
References: The Radio Amateur's Handbook can provide some general grounding and
shielding principles, while a good college physics text can explain why these
shields are effective.
You might look at Halladay & Resnick or the Berkeley physics series.

For several days, I've heard this very peculiar signal:

unidentified: several hours of what sounds like audio feedback, with varying p
                      itch, am, @1850Z
                      [location?]__________ 14.5630____call?   (B. Parnass)

Can anyone identify the source of this persistent signal? It's quite strong
here in northeastern Illinois. Is it some type of speech scrambling?

I've heard it on two different receivers 8 miles apart, so it's
not generated by some neighbor's appliance.

Another possibility, Avanti sells some antennas that are coupled thru
the window. The coax runs to a transformer that is epoxy'ed to
the rear window, the antenna has the other half that epoxy's to
the outside. I don't know if they make a 2 meter version, but I
know a guy that has a CB version that works fairly well. I'm sure
it is a compromise over most all other methods, but it is an option.

The hole mounted Larsen has always given me excellent performance
in commercial and ham uses.....Dave Chasey -- WN9NBT

Here is the text of the item in RIB regarding the modification of Sony
2002s to correct the "pulling" problem. This is from the November 84
issue, page 39:

From Ken Maxwell, Albany, NY, via telephone call Dec 6 (RIB cover dates are
usually behind the actual content date):

Regarding the "pulling" problem on some ICF-2002s -- not only does modifying
it void the warranty, but this can be fixed free if the unit is within the
one-year warranty. I've learned that a 26-part modification is available
which may cover other problems too. Calling their 800 number may get the
run-around; I went through my local rep Steve Sneider, 617-329-8479. Note:
new 2002s already have the mod installed; not applicable to 7600D version.
Call first, but I sent to Sony Consumer Service Corp., Attn: Mr. Min Ito,
386 Route 17 South, Mahwah, NJ 07430. This is the preferred procedure
since modifications must be type-accepted by the FCC. This presumably hasn't
been widely publicized in order to prevent a flood of warranty claims.

End of item

What is interesting about this info is what it doesn't say. I'm wondering
whether the non-applicability of this mod to 7600D models means that:

1) They don't need it -- the circuit changes have already been incorporated
when they were made. (Perhaps a batch of 2002's were made first, lacking this
correction, then the assembly line was upgraded, and 7600D's and more
2002's were made, all incorporating the fix? That seems unlikely, as I thought
7600D's were released overseas before 2002's were sold in the US.)

2) Sony of America simply will refuse to work on 7600D's -- I know this is
true for warranty work, since there is no US warranty on those, but what
about simple paid-for non-warranty shop work?

3) There really is enough difference internally between the 2002 and 7600D, contrary to published info and long-accepted rumor, that the mod is really inapplicable to 7600D circuitry.

I have no idea of the answer to this; if anyone knows or learns the truth about this, please post it!

Regards,

Will Martin

Why buy an interface? You can build one for less than $50, and that includes the box, cables, and power supply. Using the Exar chips, a basic RTTY interface can be built with just two additional chips, a 1488 and a 1489. If you get ingenious, you can even get rid of these. The only other chip you might want is a driver for TX function. This makes a total of 5 chips, plus passive parts. Chip cost is under $12. If you're like me, the board will lay out exposed for a long time till you finally box it.

The only difficult part is all the gottcha's on the RS-232. Things like will your RS-232 transmit without CD? How hard is it to use DTR to trigger your transmitter? This kind of stuff. If you build it in a box with switches, you can just hardwire a forced CD and CTS and use a dumb terminal package to transmit and receive.

Hardware is the easy part, just tedious. The software can be as complex
as you want it to be.

Subj: UoSAT Bull #106 (Edited)

**** UoSAT Bulletin-106 (Edited) 4th January 1985 ****

UoSAT Spacecraft Control Centre, University of Surrey, England

** GENERAL NEWS **

 A H A P P Y and P R O S P E R O U S   N E W   Y E A R

 to all UoSAT Experimenters - worldwide - from the UoSAT Team.

* UoSAT Opportunities at UoS *

There are opportunities for Research Fellows, Assistants and
Technicians to work on the UoSAT Spacecraft Programme at UoS
supported by grants commencing immediately. Details of
responsibilities and requisite qualifications will appear in
next Bulletin.

* Bulletin Information Sources *

The generation and editing of the weekly UoSAT Bulletin is a considerable task for the small team at UoS and therefore we welcome contributions from all sources providing the content is of general interest to satellite users/experimenters. Much general news is gleaned from ASR and other sources worldwide via Telemail. Due to the limited space available for the UoSAT-1 Bulletin, this information is generally edited and condensed and it is not always possible to acknowledge the source in detail. It is quite a problem to 'shoe-horn' the Bulletin to fit efficiently into the OBC memory - we regularly have just ONE byte spare! So you can see that, at times, every letter/space etc counts! We are, however, very grateful for the information passed to us and we hope that the UoSAT User Community finds the service and content interesting & useful.

* UoSAT-OSCAR-11 Stabilisation *

Automatic attitude control manoeuvres, carried out by the OBC, successfully restored gravity-gradient stabilisation to UO-11 after inadvertant destabilision last November - all is OK.

* NOAA-9 *

NOAA-9 was launched at 10:42 gmt on 12 December and is scheduled to enter service on 1st February 1985.

** UoSAT-Oscar-9 Schedule **

The UoSAT-1 Experiment Schedule will change from 110185 to reflect majority interests of the user community derived from an analysis of the many reports and suggestions received during 1984. It is, of course, not possible to please everyone and some of the suggestions would necessitate a great deal of software development which we cannot, at present, support - but we hope that the new schedule will meet with general approval. Comments are welcome however!

The new schedule will be as follows:

```
Friday    -  load Bulletin
Saturday  -  Bulletin/1200 bps telemetry
Sunday    -  Bulletin/1200 bps telemetry
Monday    -  DIGITALKER/1200 bps telemetry
Tuesday   -  Radiation data - next week CCD data
Wednesday -  Computer check-summed telemetry
Thursday  -  Whole orbit telemetry survey
```

This weeks schedule is as follows:

```
Friday    -  load Bulletin
Saturday  -  Bulletin/DIGITALKER/1200 bps telemetry
Sunday    -  Bulletin/DIGITALKER/1200 bps telemetry
Monday    -  Bulletin/DIGITALKER/1200 bps telemetry
Tuesday   -  CCD Camera - next week Radiation data
```

```
    Wednesday -  Whole orbit telemetry survey
    Thursday  -  Computer check-summed telemetry

The 21 MHz Beacon will be in use this week.

** UoSAT-Oscar-11 Operations **

They make a 2 meter and 220 version, and I suspect a UHF version as well.
A friend of mine has one. They work suprisingly well. They are not a 5/8,
but usually they can be mounted high up on the rear window and do better
than some normally better antennas that may be mounted lower on the trunk.

Jeff , I work for a commercial x.25 network. We are doing a lot of
research in the area of packet communications. I have an AIR-1
device that works self contained on a Vic 20 or 64. I have
found that you can do acii,baudot,tty but, the big drawback is the fact
that the hf frequencies are not stable and without an excellent signal
the units on the maarket do not work well and you get junk. I g have
what is supposed to be one of the best units.

Where can I get a manual for a Drake R2-A? Is Drake still in business,
and does anyone have an address for them? Or I will gladly pay photocopy
and postage to anyone willing to send me a copy.

I heard a CW signal apparently from a satellite (i.e. doppler shifted)
this evening between 1807 and 1815 local time (8th dec 0007-0015Z)
on 29.401Mhz. It was transmitting the number 5015   7 times followed by the
number 55 and then repeated this whole sequence all the time. I could not stay
to listen to it to get its time of LOS. Although its frequency is the HF
beacon for RS-3, none of the RS birds were above the horizon at the time.
Can anyone identify it?
tnx + 73

I noticed Radio Nicaragua was getting level 2 jamming.
6.0150 0450Z Carrier Jamming commenced when news of U.S.
exercise was beginning. It's nice to have a war in your
own back yard.

Sorry if you've seen this before, but netnews has not
been functioning properly for several days through our
backbone processor, ihnp4:
============================================================
     Michigan mobile scanner law (from the 1/85    issue of the
     RCMA Newsletter):

      VEHICLES EQUIPPED WITH SHORT WAVE LENGTH RADIO
                RECEIVING SETS

        (M.S.A. 28.776) (AS AMENDED IN COMPILED LAWS 1957)

     Section 508.  "Any person who  shall  equip  a  vehicle
     with  a  radio  receiving set that   will receive signals
```

sent on frequencies assigned by the Federal Communications Commission of the United States of America for police purposes, or use the same in this state unless such vehicle is used or owned by a peace officer or bona fide amateur radio operator holding a conditional, general, advanced, or extra class amateur license issued by the Federal Communications Commission, without first securing a permit so to do from the Director of the Michigan State Police upon such application as may prescribe, shall be guilty of a misdemeanor, punishable by imprisonment in the county jail not more than 1 year or by a fine of not more than $500.00 or by both such fine and imprisonment in the discretion of the court."

What's in store for the Bearcat scanner product line after its aquisition by Uniden? An article about the upcoming Consumer Electronics show in the December 1984 issue of "Consumer Electronics" relates:

"The company [Uniden] is also displaying two new Uniden Bearcat scanners, which will be available for shipment in the third quarter of 1985."

"'We're hoping to revolutionize the scanner radio

business in the U.S. with a sizable engineering commitment to redesign the table top or syn-
thesized scanner,' Mulhall [consumer group Executive VP] says. New models being shown at CES include a fully synthesized table top programmable scanner with a suggested list of $99 and a handheld scanner with a suggested retail price between $99 and $149."

As for Fox Marketing:

"The company will also introduce three programmable scanners later in 1985, and prototypes will be on display at CES...."

I just ran a check on the reported time for Pete's observations and found that RS-8 was just setting (at 00:07 UTC) (I assume you meant the 8th of January, not December, Pete!)

One possibility is that you were hearing below-the-horizon signals from a bird, probably RS-5, since I heard a report last night that it is failing and the telemetry is sending garbage. (After all, 10 meters *is* supposed to be a DX band, at least once in a while).

This has been reported numerous times with 10 meter satellite beacons, and the phenomenon seems to occur most often when the satellite is near the antipode. At that time, RS-5 was at an elevation of -65 degrees to your QTH.

Here are some vhf/uhf FAA frequencies for Illinois. Many of the entries marked "govt recds" are from US Government files dated May 1984. Several of these frequencies are in use in other areas of the USA.

There are many more, particularly in the 225 - 400 MHz military aero band and the 108 - 132 commercial aircraft band, but they are just too numerous to print in one listing.

The FAA also maintains several networks on the HF bands.

I am interested in listening to SW and I would like to get a good portable radio. So far the only discussion I have seen has been on the Sony ICF-2002 and ICF-7600. Are there any other radios out there I should consider? I don't know anything about short wave so I am not sure what I should look for. Also if I can still find a Sony ICF-6500 is it a good radio to get. I know it has an LCD display but does it have quartz lock tuning? Since I am new to this I am not even sure if I should be looking at portables or a base unit. Any and all suggestions will be greatly appreciated. If there are any books or magazines I should read to help me get started let me know. Thanks.

800 MHz Land Mobile Monitoring Using a TV

I can monitor some of the land mobile services on the 800 MHz band by tuning my Zenith Space Command 19" television set to channel 79. The bandwidth of the TV is really too wide, permitting simultaneous reception of several signals, but this is actually useful during times of little activity.

My TV has no squelch so listening to the white noise becomes fatiguing. Aren't there some TV's with squelch (muting)?

Has anyone else tried this?

I'm trying to build a junk-box special linear, using a pair of 8122 tetrodes.

The only technical literature I've been able to find lists CCAS parameters, and not ICAS specs. As the 8122's are a c-note apiece to replace, I'd prefer not to fry 'em when I throw the switch.

Anybody out there have any specs on ICAS limits on the 8122's?? Is 3KV on the plate / 400 on the screens permissable in ICAS service?? HELP!!!

Also, I understand National Radio used a pair of 8122's in one of their linears.... perhaps the NR-2000. Anyone have a manual for said beast that I could photocopy. (I'd be happy to re-imburse for reasonable copy/postage fees.)

When I lived in Naperville, I could also detect cellular radio signals
on a UHF TV. However, not only is the audio bandwidth too wide, but
a typical TV set depends on the presence of a strong video carrier
4.5 MHz below the audio carrier in order to provide the subcarrier
through AM detection that the sound discriminator needs.

Curious (or is it?) that this appears to coincide with preparation for
Big Pine III, the combined naval/air/ground war games that are
scheduled to begin very soon in the Carribean...?

Conjecture: The carrier [which sounds like audio feedback] is
jamming from some source on the "other side," and the audio
SSB you are occasionally hearing underneath is legit from "our side."

The Sony models ICF-2002 and the ICF-7600D (note the D) are the
same radio; the 7600D is the European/Japanese model and is now
available with a power supply for 220/110 VAC.

I'd recommend it. I've been a ham for a long time and an SWL for
even longer, and because of various deed restrictions and some
previous financial difficulty I sold off all my high freq ham
gear about four years ago. Since then, I've had a hankering
to listen again, so went out and bought a 7600D at 47th St. Photo
(about $195 and worth it). With the external antenna it comes with
strung out and clipped in my backyard, this little radio works
at least as well as some of the HF gear I used to have.

Go ahead and get one. I no nothing, however, about the other
radios you mentioned.

The jamming may be our side. The military sometimes uses omni antennas
to broadcast a jam and directional antennas to broadcast the data/voice.
This means that you must be in line to get the signal. Every little
bit helps.

Sorry to be so long in replying, but the route from notes to me had
been constipated for over a month......
I have been usin the TAPR board for about a year, and like it and its
documentation so much, I bought another (no, not the company). The GLB
initially had several poor design problems (cannot talk and listen at the
same time) though I understand this problem has been worked upon for
present/future revisions. Other options include VADCG (vancouver club)
boards, and TRS-80 software versions (no HDLC chip), which may be
worth considering. I believe the reason TAPR gets most press will be
obvious when you get the kit: absolutely first class design, accessable
to the "bearded experimenter", great documentation, good modem design,
flexibility in every feature, and plenty of features in software and hardware.
I am sold on the TAPR kit, a great job for a non-profit club activity.
An off shoot version is also available built and tested from AEA for about
$500.00, and I think TAPR will build for you for a price.
Present and future plans include coast-to-coast digital VHF/UHF links,
ongoing 6 meter meteor scatter tests, level 3 (ISO OSI model) software
design and development (including a write-off contest between the datagram
vs virtual circuit factions). Its a great way to combine computers and
ham radio, and there's lots of work to be done in this new mode.

TRICK FOR OUT OF BAND RECEPTION ON UHF RECEIVERS

Bob Parnass, AJ9S

Articles in Monitoring Times and Popular Communications have described how one may "trick" various scanner radios into receiving frequencies they were not designed to receive. These tricks fall into 2 categories:

1. Exploiting a bug in the receiver's microprocessor firmware by entering a particular series of keystrokes.

2. Exploiting the receiver's finite image rejection by listening to simple images (e.g. to listen to frequency F, tune the receiver to F + 2 * [the intermediate frequency]).

This article describes a third technique, which permits listening in the 512 - 657 MHz range (UHF television channels 21 through 44) using radios designed to receive the 402 - 512 MHz range. The technique uses "multiple injection frequencies", and requires no receiver modification or additional hardware.

I discovered that my Radio Shack PRO30 scanner receives the audio from TV channel 38 (619.75 MHz) when the radio is programmed for 483.5375 MHz, and from channel 32

(583.75 MHz) when programmed to 456.5375 MHz. This is also true for the Radio Shack PRO2020 scanner.

Bearcat BC100, BC210, and BC350 scanners can also receive UHF TV signals on odd frequencies, but at different pro-
grammed settings: 483.7125 for TV channel 38, and 456.7125 for TV channel 32 (Bearcat and Radio Shack scanners use different intermediate frequencies).

By checking the arithmetic, I've concluded that the same mechanism permits out of band reception on all these scanners.

The Method

In the formulas that follow, all frequencies are in units of Megahertz. To listen on a frequency U between 512 and 657 MHz, tune your radio to:

$$\frac{3(U) - 7(IF)}{4}$$

where IF is the intermediate frequency of the receiver.

Conversely, if you hear a strange signal when your UHF radio is tuned to T MHz, you may be simultaneously listening to the frequency of:

$$\frac{4(T) - 7(IF)}{3}$$

When using this technique to receive TV audio on a scanner, the signal may be weak or distorted because:

- The bandwidth of a TV audio signal exceeds that of the IF filtering in the typical scanner.

- A typical scanner radio is not as sensitive in the 512 - 657 MHz range as it is on the frequencies for which it was designed, due to the inability of the front end tuned circuits to resonate out of their normal range.

- The TV signal format maybe unconventional. Chicago's channel 44, a pay TV service, scrambles the video and transmits the audio signal using an unconventional format not known to this author. PRO30 scanners receive Chicago channel 44 audio when programmed for 510.4875 or 510.5875 MHz.

Technical Explanation

What's happening is that an injection signal with multiple constituent frequencies is being being fed to the mixer stage.

To hear the audio from TV channel 32 (583.75 MHz), the PRO30 is set to 456.5375 MHz. At this setting, the local oscillator/tripler chain is injecting a signal into the mixer stage at:

456.5375 - 10.7
= 445.8375 MHz.

This 445.8375 MHz signal is the output of a frequency tripler, whose input frequency is:

445.8375 / 3
= 148.6125 MHz.

But, in addition to this 3rd harmonic, there seems to be a 4th harmonic component present:

4 (148.6125)
= 594.4500 MHz,

which when mixed with a signal on 583.75 MHz (channel 32), produces a 10.7 MHz IF:

594.4500 - 583.750
= 10.7 MHz

Other Frequencies Possible

Although the scheme described in this article requires no scanner modifications or additional hardware, a multiple injection scheme forms the basis for a product already familiar to scanner enthusiasts, the Grove "Scanverter."

The Scanverter, a novel 216 - 420 MHz converter, makes use of multiple injection frequencies to accomplish what Bob Grove terms "band stacking". In the Scanverter, a local oscillator produces a signal rich in harmonics. This signal is fed into a broadband mixer along with signals from the antenna, causing several frequencies to be received at each setting of the attached scanner.

The ability to receive TV signals on a scanner is usually of little value, but there may be ways of using this multiple injection phenomenon to receive bands other than 512 - 657 MHz. I recall receiving the 787.75 MHz audio from TV channel 66 somewhere on a BC100 once!

A simple scanner modification may be possible that purposely distorts the injection signal in a way that produces both the fundamental frequency and its second harmonic. Theoretically, this could cause a scanner with a 10.7 MHz IF and 420 - 512 MHz coverage, to be receptive to signals in the 807.9 - 991.9 MHz band. Readers are urged to experiment to find other frequencies to which their scanners may be receptive. A well calibrated, harmonic-free signal generator would be helpful.

Don't bother to post the obvious ones at all (like the few navaids you
have posted). If you want to know what they are you can go about it one
of two ways.

The Airport Facilities Directory lists Frequency for navigational aids
and airport communcations by Name. Each entry includes type and lat/long
coordinates for the station. This includes listings for ILS systems.
Also, an explanation on how the ILS system works appears in the Airmans
Information Manual.

For those who prefer a more pictorial view, you can get the Sectional or
WAC charts for your area.

You can find all of these at your local general aviation air port.

Sounds good. I've been looking at short wave radios also (not necessarily
portable). Does anyone else have any other suggestions?

I am especially interested in receiving Hebrew-language broadcasts
from Kol Yisrael (the Voice of Israel). I have the following
questions: Does this station have any Hebrew-language broadcasts?
If not, has anyone ever received this station (especially in the
mountain area of the U.S.--Colorado, New Mexico, etc.).

If someone has gotten this station, what receiver were you using?
Would I have any trouble receiving it with the Sony mentioned above?

Thanks in advance.

At about 1800Z on 1/15/85, the unidentified "feedback" signal was still
going strong.

For the first time since I began monitoring the frequency (sporadic
basis since Christmas vacation), what sounded like a SPREAD SPECTRUM
signal also appeared, centered around this frequency.

On past occasions, males speaking Spanish on lsb could be heard under
the "feedback" signal on 14.563 MHz.

Now I'm certain that these signals are not used for commerce.

New Sony AIR-8 VHF-HI/AIR/AM/FM/LF Scanner

Sony, a well known name in the consumer electronics business, has introduced a portable scanner aimed particularly at aviation enthusiasts. Here is the information I have:

Frequency coverage includes:

- commercial aviation 108-136 MHz.
- low frequency weather 200 - 400 KHz.
- vhf-hi public service 144 - 174 MHz.
- AM commercial broadcast
- FM commercial broadcast

There are 10 memory channels in each of 4 bands. Apparently, channels in different bands cannot be intermixed. The unit will "scan the entire aero band at the touch of a button in either direction."

Appearing as a cross between an ICOM IC02A 2 meter walkie-talkie and a piece of aero nav equipment, the top of the Air-8 contains rotary bandswitch, along with

squelch and volume controls. A top mounted BNC connector joins the flexible antenna with the radio. The back lit LCD display on the front displays frequency and prompts. No speaker grille is visible in the picture I have!

Selectable delay on a per-channel basis, and priority channel sample are enabled by front panel pushbuttons. The Air-8 also has jacks for earphone and external AM antenna. Power is supplied by 4 AA batteries.

The price I saw quoted was $269.

de WE6B bt

I recently built a TU for my c64 and am experiencing occasional reception errors. This particular TU uses NE567 tone decoders for the demodulator. I'd like to know if anyone else is using the c64 in rtty applications, what type of TU is being used and an estimate the error rate. Also whether you use mostly HF or VHF for rtty work.

Any suggestions or comments are welcome. TNX

From another newsgroup:

"WAVTEK has developed a new microwave frequency chart that outlines microwave applications by frequency. The chart allows users to identify commercial and military activities in the 1 to 44 GHz band at a glance. Satellite communications uplinks and downlinks for the commercial C- and Ku-bands, military C-band, DBS and MILSTAR are identified, as are the frequency bands for common carrier microwave links. Contact: Charles Foster, manager, Microwave Business Unit, Wavetek San Diego, P.O.Box 85265, San Diego, Calif., 92138, (619) 279-2200."

hr arrl bulletin nr 3 from arrl headquarters
newington ct january 16, 1985
to all radio amateurs bt

some volunteer examiner teams working with the arrl vec are now accepting walkins. if you know of a test session and did not submit your form 610 before the 30 day preregistration deadline, check with the ve team anyway to see if they will accept walkins. the ve team has the right to limit the number of candidates because of the number of available ves or the size of their facilities.

the arrl/vec maintains a computerized list of all test sessions known to us, updated weekly. send a business size s.a.s.e. to the arrl vec office, 225 main street, newington, ct 06111 and ask for a printout of test sessions in your state. persons living near a state line may ask for the adjacent state as well ar

hr propagation forecast bulletin nr 2 from arrl headquarters
newington ct january 13, 1985
to all radio amateurs bt

the exceptional run of very low solar flux reported last week continued through january 11. for ten of these days the reading was seventy. on the fifth it dropped to 69. at this time of year this is very close to quiet sun conditions. no comparably quiet period appears in the records for cycles 18, 19 and 20 more than a few weeks from the end of any cycle.

this does not necessarily imply that cycle 21 is about to end more than two years short of the average length of all cycles for which accurate records are available.

what it does tell us is that our higher dx frequencies can hardly be worse than they have been since late september, regardless of how near or far we may be from the end of cycle 21.

the solar flux rise predicted last week is under way and the upswing is sharper than expected. the flux reached 75 on the 12th. two more days at this rate could make a marked change in the dx picture on all bands. the author has had poor sun viewing weather thus far. if significant visual observation is possible we will pass along results at once in a special bulletin. meanwhile, checking of the beacon range between 28.175 and 28.3 mhz is recommended.

american sunspot numbers for january 3 through 9 were between 0 and 2 with a mean of 0.3 ar

qst de k9eui

bulletins have been sparse lately for several reasons; there have not been many, propagation has been stink-o, and qrm seems worse, both due to propagation changes and increased 80 and 40 meter activity because the higher bands are so bad. Also radio moscow is now blasting North America with their sigs on 5 frequencies in the 40 meter band alone!

I have written the arrl, requesting that they consider a change of their bulletin frequencies. It is quite obvious that they do not monitor a frequency before transmitting and this often results in murderous qrm. Also on 40 meters, they are just a few kHz away from a mail box system.

I requested that W1AW begin bulletin transmissions on 30 meters which would give another path to choose from but they said "the board voted not to"!!!!!

I have just installed a diversity comparator that I hope will give better results here but I would like to see those of you that appreciate having the bulletins, write the ARRL and urge them to go elsewhere on 40 meters, and to also transmit on 30 meters. (I expect to see flack/flames on this idea, but my suggestion was that they move to the very bottom of the bands where they would be easy to find and would not have other rtty qrm). The other problem with the present 40 meter frequency is frequent qrm from thos stations that are allowed to operate SSB there.

From the January 15, 1985 issue of "Radio Communications Report":

"The City of New York, acting through its Department of General Services, is seeking proposals for the lease of one subcarrier, at 67 kHz, of WNYC/FM......"

"WNYC/FM services audiences in the New York City metropolitan area operating on 93.9 MHz at a rated power transmitter output not exceeding 10 kw."

Now that subcarrier paging is legal, what FM stations in the Chicago area are transmitting information on subcarriers?

I'm considering connecting my shortwave receiver (with VLF coverage) to an FM radio, before any low pass filtering, to listen in if there is enough activity.

Does anyone else on the net listen in?

VITA NEWS RELEASE

JANUARY 17, 1985

FOR IMMEDIATE RELEASE

FOR FURTHER INFORMATION*

ANNE HEYNIGER, VITA PUBLIC
INFORMATION OFFICER
(703) 276-1800

BREAKTHROUGH IN LOW-COST TELECOMMUNICATIONS

RADIO AMATEURS COMMUNICATE WITH LOW-ORBITING SATELLITE

USING A TINY SATELLITE NOW ORBITING THE EARTH OVER THE POLES AT AN ALTITUDE OF 429 MILES (690 KN), A TEAM OF TECHNICAL VOLUNTEERS FROM THE U.S. AND CANADA YESTERDAY SENT LETTER-PERFECT PACKET RADIO MESSAGES TO ENGLAND FROM HAWAII, AND RECEIVED REPLIES. THE TRANSMISSIONS REPRESENT A BREAKTHROUGH IN THE USE OF LOW ORBITING SATELLITES FOR WORLDWIDE COMMUNICATIONS.

INTRODUCING THE NEW CONCEPT AT THE PACIFIC TELECOMMUNICATIONS COUNCIL'S ANNUAL CONFRENCE IN HAWAII, HIGHLY TRAINED TECHNICAL EXPERTS FROM PRIVATE VOLUNTARY AGENCIES IN THE U.S. AND CANADA SENT MESSAGES TO THE UNIVERSITY OF SURREY IN GUILDFORD, ENGLAND, WHERE THE SATELLITE (UOSAT-2) WAS BUILT. THE MESSAGES--DIGITIZED "PACKETS" OF INFORMATION--WERE STORED IN THE SATELLITE'S ON-BOARD COMPUTER. A FEW HOURS LATER, AS THE SATELLITE PASSED OVER GUILDFORD, THE LETTER-PERFECT MESSAGES WERE DOWNLOADED AND PRINTED OUT AUTOMATICALLY BY THE SURREY GROUND STATION'S SMALL PERSONAL COMPUTER.

USING AMATEUR RADIO FREQUENCIES, INEXPENSIVE TRANSMITTERS AND RECEIVERS, AND PERSONAL COMPUTERS TO COMMUNICATE WITH A LOW-ORBITING BIRD, THE SYSTEM THAT WILL UTILIZE THIS TECHNOLOGY IN THE FUTURE (ALREADY KNOWN AS PACSAT), WILL OFFER TELECOMMUNICATIONS NETWORKING AT A FRACTION OF THE COST OF CONVENTIONAL TELEXES. ONCE OPERATIONAL, THE PACSAT SYSTEM WILL PROVIDE ORGANIZATIONS THROUGHOUT THE WORLD MUCH-NEEDED ACCESS TO LOW-COST, RELIABLE TELECOMMUNICATIONS. GROUND STATION EQUIPMENT, COSTING NOT MORE THAN $2000 AND CAPABLE OF OPERATING ON BATTERIES OR SOLAR POWER, CAN BE CARRIED IN A BRIEFCASE. THE FIRST FULL-SERVICE PACSAT SATELLITE IS SCHEDULED FOR LAUNCH ON THE SHUTTLE IN EARLY 1987.

SPEARHEADING THE DEVELOPMENT OF THIS TECHNOLOGY ARE VITA (VOLUNTEERS IN TECHNICAL ASSISTANCE), A PRIVATE VOLUNTARY DEVELOPMENT AGENCY IN WASHINGTON, D.C. THAT SPECIALIZES IN TECHNOLOGY TRANSFER; AND AMSAT (RADIO AMATEUR SATELLITE CORP.), AN INTERNATIONAL ASSOCIATION OF HAM RADIO OPERATORS WHO ALSO DESIGN AND BUILD SATELLITES. INTERPARES, A PRIVATE CANADIAN AGENCY ENGAGED IN COMMUNITY-BASED DEVELOPMENT, SUPPORTS THE EFFORT IN CANADA.

IN WASHINGTON, PACSAT INTERNATIONAL APPLICATIONS MANAGER, DR. GARY GARRIOTT OF VITA, SAID OF THE CONTACT IN SPACE, "I JUST WISH THE PEOPLE COORDINATING FAMINE RELIEF IN ETHIOPIA HAD A PACSAT TO COMMUNICATE WITH. THEY COULD USE

SOLAR ENERGY TO POWER THE RADIO. IT WOULD SOLVE A LOT OF PROBLEMS IN GETTING HELP TO THOSE REMOTE PLACES."

END

Yes, KOL has Hebrew broadcasts, and some of them are beamed
to North America. I've heard it quite well on my 7600D with
the outside antenna, but I'm near New York City (and there's
no mountains around here, darn it).

Summary:

I just ordered a Uniden 2021 from Grove Enterprises. They bought out another dealer and thus are selling them for a bit more than what was the going rate $99, but their price $124.50 including shipping is from what I've heard, still a good deal. The Uniden is a portable unit that is an upgrade of the 2001 by Sony and is almost exactly the same as the Radio Shack DX-400. (The Uniden has a 5LED signal strength meter whereas the DX400 has a analog meter. They have about 30 left. You send them a check to P.O. Box 98 Brasstown, NC 28902 or you can order by credit card though there is a 3% surcharge. (I ordered it by Master Charge since this is always the best option with mail order purchases.) They told me that if I was not satisfied I could return it within 15 days for a full refund. This was important to me as I am still unsure if it is sensitive enough to pick up Kol Israel broadcasts. Their toll free number is 800-438-8155. Send me a note if you decide to get it, and what your experiences are.

The problem with 567's as TU decoders is that with proper lowpass filtering, they do not respond fast enough. Rather than use tone decoder IC's like the 567, you should use either a 565 with a slicer after it (a sample circuit is in the Signetics data book), or better yet, one of the PLL chips that is designed for that purpose like the Exar XR-210.

In any case, a PLL demod is lousy on the HF bands without channel filtering ahead of it, or it will lock onto the strongest signal within its capture range. They should be preceeded by either toroidal or active filters tuned to mark and space tone frequencies. Also, the VCO in the device should be tuned (with no signal input) to midway between mark and space.

Since some indicated an interest on how our case of TVI was solved, here it is:

As you recall, The cities of Batavia and Geneva, IL. were experiencing a severe case of TVI to channel 5 (Chicago).

I located the source as being a 75.8 MHz paging transmitter on the East side of Geneva (30 watts).

The FCC finally investigated and confirmed what I had found, that the transmitter was clean and it was a case of adjacent channel interference.

The FCC issued them a citation and have given them 90 days to relocate their transmitter. I was told yesterday by the FCC that the transmitter will be moved to Sears tower.

Here are some Illinois frequencies active in the winter. The best frequency
to listen to for (major) highway road conditions is 151.1 MHz, the Illinois
Dept of Transportation "Minutemen".

x
            Comquest   SXP-210   Scanner   Expansion Package

   There was a demonstration at the Wheaton Hamfest of a new $110
   software package that allows a Commodore 64 personal computer to
   control a Bearcat 210XL scanner. The SXP-210 comes with software
   on a 5.25"   floppy   diskette and a   special   interface cable, which
   connects the   64 to a   ribbon cable within the 210XL.

   Uniden's hasty withdrawl of the Bearcat CompuScan 2100 leaves the
   SXP-210 as the only product   that will allow   a personal computer to
   control a VHF/UHF scanner.

   Some   of the more interesting features listed   in the
     sales litera-
   ture:

      -   Expands   [stock]   18 channels to 50.

      -   Removes   the software constraints [of   the   stock   210XL]   that
     prevented operation on the 6m and 10m amateur bands.

      -   Color graphics that identify type of radio service being moni-
     tored. (Police,   Fire, Amateur, etc.)

- With a printer you can generate a chronological log of selected channels as they become active along with the time of day that the transmissions were received.

- Includes 12 hour time of day clock w/AM and PM designations.

- Adds a "count" feature to the 210XL, similar to the one on more expensive scanners.

- Edit mode allows flexible control of all channel info.

- Includes an improved search mode with a "Hold" [?] trigger feature.

- Channel lockout/selective scan delay.

- Includes a special list function that displays freq info for all 50 channels simultaneously on one screen.

Installation appears simple. A pliers is used to crimp a supplied socket onto an existing ribbon cable within the 210XL. An umbilical cable plugs into this socket and into the computer.

One drawback of the this 64/BC210XL setup is the scan rate rate of only 8 channels/sec, about half the scan rate of a normal 210XL.

For more info, contact:

WOW! GOLLY! GEE WHILLIKERS! (And other expressions of excitement...)

A new Sony portable Shortwave (and other coverage) radio is due out soom! This info is culled from the report presented on Radio Nederlands "Media Network" program, GMT Friday, 18 Jan 85. This is all I know:

Keeping up their tradition of confusing model numbers, this new Sony radio will be known as the "2010" in the US, and the "2001D" in the rest of the world. I'll just say "2010" to avoid confusion with the original 2001 model. It is due to be on the US market in March/April 85, and will have a list price around $300 US. It is slightly smaller than the original 2001, weighing 1.8 kg with batteries, and measuring 29 X 16 X 5 cm. Has a 120 cm whip antenna. Power is by 3 D-cells drawing 150 mA (which is far better, and giving far longer battery life, than the old 2001) and 3 (NOT 2!) AA-cells for the computer.

It has 68 - count them - 68 push buttons! (Whee! Love them buttons!)

It has a digital display (LCD, I assume; I seem to have missed that in my notes), of course, and covers (get this!) 150 - 29999 kHz, 76 - 108 MHz FM, AND 116 - 136 MHz Aeronautical band! In addition to the usual direct-keypad frequency entry, it has KNOB tuning too. (Something I have sorely missed on my Sonys & Uniden -- last night I was using my old Hallicrafters and marvelling at the ease of tuning by merely turning a knob... the great wheel of life is turning full circle again...)

Anyway, the knob tuning works in steps; on LW, BCB, & SW, you can choose 100 Hz or 1 kHz steps -- on FM VHF, it works in 50 kHz steps, and on Aeronautical band, in 25 kHz steps. Standard 10 kHz or 9 kHz BCB station-spacing is switch-selectable. (I guess for scanning?)

There is a 10-LED signal-strength meter which doubles as a battery-strength indicator. There is a built-in 12 or 24-hour clock and timer. It uses the TUNING KNOB to set the clock and timer! There is a switchable dial light. There is a recorder output, at low [mike] level (usual Sony practice). There is a 1/8th in. (3.5 mm) headphone jack, wired for stereo headphones (no mention that the FM was stereo, though, so it probably isn't -- I wonder why; it could be done for one or two more chips at little incremental cost, and be a good selling feature).

Memories: 32 - count them - 32 memories; using 32 buttons, in a 4 X 8 matrix. However, there is also a "shift" button, like on calculators, which makes the memory buttons also function as "jump to band X" controls, so, by hitting two buttons, you jump to the lower end of any SW broadcast band, FM, BCB, etc.

Scanning: scan between any two frequencies selected, or can scan the 32 memory channels, pausing 5 seconds on each one. (No info given on scan rate, steps, or limitations.)

New gimmick: A "SYNC" control. Push this button while tuned to an AM signal, and it goes into an automatic ECSS (exalted carrier single sideband) mode. That is, you can choose USB or LSB, and the radio suppresses the station's carrier and injects its own. This reduces some forms of distortion and interference, especially on SW. However, there is a failing (maybe just in the sample tested?) -- the SYNC circuits introduce a great deal of noise of their own on higher-frequency signals (e.g., most SW broadcast bands). However, the circuits do work; the testers were able to "easily" separate the two programs carried on ISB feeder signals! (Independent Side Bands -- many broadcasters using SW relays put two separate signals on a single transmission, one program on each sideband.)

Selectivity: two switchable AM bandwidths. Wide said to be "somewhat too wide" (no numbers given); Narrow = 3 kHz @ 6 dB, said to be effective. Filters characterized as "fair".

Sensitivity: Very good. Has a variable RF Gain control, plus a DX/Local attenuator. Worked best with that left on "DX".

Antenna connections: Radio is matched well to its own whip antenna; using a 10-meter longwire on SW did no good and actually reduced some signals. Separate connections available for VHF Air and FM.

WOW! After the dust settles, this should be discounted to $220 or maybe even lower, so those of you who didn't get a Uniden can now run out and get a newer better toy! And the rest of us can work on how we can justify yet another radio... (If I keep buying these things, I'll NEVER get an ICOM... :-)

Yours in the lust for material possessions,

Will Martin

FM SCA listening is fun and sometimes worthwhile. One of the best source for info on the subject is the FM Atlas people. Their address is simple: FM Atlas, Adolph, MN (but I forget the Zip Code, the hard part). I've bought a couple SCA decoders from them, and a radio with a built-in decoder and switch, which I gave to my mother as a present. They sell a fancy decoder from Capri Electronics for $98, which has tunable subcarrier dectection up to several hundred kHz or so. I bought one, as their price was lower than direct from Capri ($114 there) and also some "security" or "anti-bugging" firms were selling the same box for over $200! (You can switch it to listen off the power line, too, to detect wireless intercoms or bugs using that technique.) You can buy a simple SCA decoder kit and build it in most FM radios for $20 or $25, which is a cheaper way to go, or buy one of their SCA-equipped radios if you didn't want to muck about in the innards of one. Their prices are fair for the radios, I think.

Anyway, of course most of what you hear is Muzak, which isn't worth paying for, in my opinion. There are some music services which have less elevator-like music than Muzak, though, which might appeal to you. I've never heard one of these adaptors, though, that really filter out the base program well enough to pipe the result into a hifi system, which would be about the only way "background music" would be of use in most home environments. If the sound from a portable radio is good enough, though, this would be worthwhile.

Other things you hear: Physicians' News Service, a program of medical news directed at MDs, laden with drug ads. Could be bizarre to listen to for a while, but soon tiresome. Farm news & agricultural commodity info; once you've heard the price of pork, will you want to hear it again? Services for the blind: this is the really worthwhile service. They read the newspaper (you could listen to the paper while driving, if that interests you) and sometimes read books or magazines. Data: a lot of you out there might want to play with this. Some data transmissions are transmitter-to-studio links, just giving the station its own meter readings. But some is commodity or stock prices, probably encrypted, the access to which is sold, along with the decoding equipment, in some major cities.

Look in your local libraries for the latest (9th) edition of the FM Atlas for more information on stations transmittng SCA and SCA in general.

Regards,
Will Martin

Does anyone know of the existence of any performance
reviews of the Drake TR5 transceiver? I have long
considered buying one, and since it appears the R.L.
Drake Co. is going out of the ham radio business, it
looks like its now or never. I have not, however,
been able to find any info on the radio's performance.

Any pointers to reviews in the literature or personal
accounts from users/owners would be appreciated. Please
respond via the net. Thanks

from the 12/84 issue of the ARRL Southern NJ Section Report:
==========

Assembly No. 2393
State of New Jersey
Introduced September 13, 1984
by Assemblymen Zimmer, Haines, and Weidel
An Act Concerning Crimes and Amending N.J.S.2A:127-4.

Be it enacted by the Senate and General Assembly of the State of New Jersey: N.J.S.2A:127-4 is amended to read as follows:

2A:127-4. "Any person who installs or has a short-wave receiver operative on frequencies assigned by the FCC for fire, police, municipal or other governmental uses, is guilty of a misdemeanor crime of the fourth degree, unless a permit therefor has first been obtained from the chief of the county police, or from the chief of the police of the municipality, wherein such person resides.

This section does not apply to any fire, police, or other governmental official of the state, or of any county or municipality thereof, nor shall it apply to a resident of New Jersy holding a valid radio amateur license of the Technician, General, Advanced, or Amateur Extra Class."

This act will take effect immediately.

Short followup: I looked up the FM Atlas address last night:

FM Atlas
Adolph, MN 55701

(This is the product of the efforts of Dr. Bruce Elving, by the way.
I had one inquiry about a telephone number. There wouldn't be a business
phone for this one-man operation, but there might be a personal listing
for Dr. Elving; I recommend contact by mail instead, though.)

We checked two that we have here. The ground to the other two duplex
outlets is supposed to be via the outlet mounting screws and the
metal case. Unfortunately, the outlet mounting screws on ours were
not tightened down enough for the lock washers to cut through the
paint on the case. We fixed that!

So if you're a resident of some jurisdiction other than New Jersey, and
have a valid ham receiver in your car, you have to remove it when you
enter New Jersey, right?

As another netter suggested, you have the right to receive whatever
signals you wish, but you just can't drive while receiving certain ones
of those signals because driving is not a guaranteed right. So I guess
you have the right to live outside of New Jersey too, but if you do,
then you might lose the right to drive in New Jersey. (That isn't the
case yet; it just needs one more step to get there.)

By the way, I have been searching my memory and back issues of RIB, PopComm,
and the SW Guide, and cannot find any reference to this, yet I am sure
I recall reading it -- does anyone know of this or can point me to a
reference? I remeber seeing (somewhere!) a mention of time and frequencies
for SHORTWAVE transmissions from Israel of their Armed Forces broadcast
service (their equivalent of the US AFRTS); this would have lots of info

interesting to those who asked about Hebrew-language broadcasts from Kol Yisrael -- it should be in Hebrew (and maybe other languages), have lots of "home-town" type news and bits, sports, etc. [sort of local Israel radio for the troops]. The WRTH lists this service on several medium-wave (BCB) and FM frequencies, but has no mention of it on shortwave. Yet I am POSITIVE I saw a reference to this being heard on shortwave!

I can think of an explanation for this: that such a service came into being after the WRTH 84 was compiled, and therefore it isn't listed. Also, maybe this is (or was) a temporary service and no longer exists. Can anyone provide more info about this? Am I simply crazed with the cold, and just totally off-base about this ever existing? Or is it a low-powered DX catch, never listed except in some obscure club column or article, and that is why I cannot find a pointer to it? Or maybe it is considered a "utility" broadcast, never listed in the WRTH anyway [like a feeder relay for a remote broadcast site], and therefore also not listed in info sources about broadcasts either?

"What I need is an index to EVERYTHING..."

Regards,
Will

qst de k9eui
hr propagation forecast bulletin nr 3 from arrl headquarters
newington ct january 20, 1985
to all radio amateurs bt

the solar flux rise of last week was still goin on, through at least the 20th. it held at 75 january 16 to 18, then rose to

77, holding for three days. it went to 78 on the 19th and then was reported by (??) to be 91 on the 20th. this is a remarkable one day rise, after the very low readings in recent weeks. if it holds, or moves higher, there should be a major change in the character of all dx frequencies, approaching their usefulness in the early months of last year.

the level of geomagnetic activity is critical. if the wwv k indices hold to mostly 3 or more, as they have recently, propagation should be much as shown in the qst dx charts for december and january. these were based on a solar flux range in the low 90s.

it should be emphasised that the timing in these charts is quite accurate, as it is based on the suns position with respect to the paths shown. the timing does not change with various solar flux or sunspot numbers. the useful frequency range for a given time period is affected by the solar activity levels.

for the balance of january, good conditions should prevail through the 22nd. high latitude paths will suffer intermittently january 23 through 29, with good propagation returning at the months end and holding through about february 5 ar

------ senate resolution 36 needs you ------

on january 3 1985 senator barry goldwater ,k7uga, introduced two resolutions. one of them ,s res 36, if adopted, will declare the sense of the u.s. senate that the fcc should affirm that state and local regulations must not unreasonably restrict communications from amateur radio stations. the other resolution pertains to the rights of citizens to erect and maintain television receive only ,tvro, satellite dishes. the amateur radio resolution will send a clear message to the fcc that favorable action on prb-1 ,the league's request for federal preemption of restrictive local antenna ordinances, would meet with the approval of the u.s. senate. your support, and the support of your senators, is needed to ensure its adoption.

the resolution reads: resolution - to express the sense of the senate relative to unduly restrictive state and local regulation of amateur radio antennas.

resolved, that it is the sense of the senate that, consistent with the policy of the united states to recognize and enhance the value of the amateur radio service as a voluntary noncommercial communication service which provides public service and emergency communications, the federal communications commission should affirm that state and local regulatory authority, including, but not limited to, zoning, public safety or health authority, and authority to grant a license or permit, must be exercised so that it does not,

1, discriminate unreasonably among amateur radio antennas and other types of home communications and,or antennas, or reception

2, have the effect of prohibiting or frustrating the transmission or reception of amateur radio communications by federally licensed amateur radio stations,

except as may be necessary to carrying out a clearly articulated and affirmatively expressed compelling governmental interest related to the health and safety of the community.

I will soon be called upon to give the tests for a Novice license. A long time ago, a novice test question bank came across the net, but some of them were outdated, and I no longer have it. If somebody has a set of current questions (with the ratios of numbers of questions from each section), or some sample Novice tests, I would appreciate getting a copy.

Also, what are the specific requirements for the code test: Is it up to the examiner's discretion? Is it a sample QSO with multiple-choice questions? Is it 5 minutes of code, of which 1 minute of perfect copy is required? What numbers/punctuation is required?

As you see, I am in need of whatever current information is available.

Thanks (in advance, of course),

John Burgess, N7DCQ

I heard R. Nicaragua on 6.015 at around 0430Z back in November,

up until they were to start their newscast, at which time an
unmodulated carrier arrived on the same frequency, completely obliterating
the signal here. At 0500Z Voice of America signed on in Spanish...

Recently someone asked me if I knew of any amateur license exams to be given
by volunteer examiners in this area. At the time, I did not.
However, it just came to my attention that a list of
exam schedules are kept online at the ARRL.
A printout of exams scheduled in your state (or any ajacent state) can be
had upon request to the ARRL (including SASE for reply)
at 225 Main Street, Newington, CT 06111.

I am posting this here in case other readers of net.ham-radio were unaware
of this information.

The ARRL Packet-Radio Newsletter
Electronic Edition
Volume 1, Number
11 January 15, 1985

PACKET NETWORK COORDINATION

The frequency-coordinating body for Northern California, NARC, has officially coordinated the following frequencies for packet radio: 145.01, 145.03, 145.05, 145.07, 145.09, 223.56, 223.58, 223.6, and 441.000 MHz. It is unclear what this means for current activity on 146.58 MHz.

NARC has also requested that all "mountain-top digipeaters placed on the assigned frequencies be coordinated through NARC, to insure proper record keeping." This brings up the question of where the jurisdiction of the frequency-coordinating council ends. Hank Magnuski, KA6M, of the Pacific Packet Radio Society makes the following suggestions:

"The [frequency-coordinating councils] are dealing with very real problems of crowded frequencies, overlapping repeater coverage, intermod, etc. It is a good idea that packet frequencies be coordinated through such councils.

"However, once frequencies have been allocated to packet radio, the jurisdiction of the frequency-coordination council ends, and another type of advisor is needed. This advisor must help track and promote the rational growth of packet radio equipment, repeaters, gateways, and protocols on the assigned frequencies. The advisor may eventually supervise the growth of the packet network.

"Therefore, I would like to propose a new term for amateur radio: 'Network Coordinating Agent' (NCA). The NCA for a region deals with the problems mentioned above, and also represents its area in national discussions of protocols and other issues.

"The Pacific Packet Radio Society, because it is the oldest and largest packet-radio club in the Bay area, has become the Network Coordinating Agent for the San Francisco area."

The need for NCAs has also been recognized on the East Coast. Groups from New England and from the Mid Atlantic states agree that congestion on 145.01 MHz must be dealt with in an organized manner. The first EASTNET NCA is the newly-formed Mid-Atlantic Packet Radio Council. This council will coordinate for MD, DE, Southeastern PA, Southern NJ, Northern VA, and Washington D.C.

Send Gateway any comments that you have on the need for NCAs.

From KA6M.

HIGH-SPEED PACKET PROGRESS

At the January 12 meeting of the Chicago Area Packet Radio Association, Steve Goode, K9NG, demonstrated his 9600-bit/s, 220- MHz modems. When the plans for Steve's modems become available (perhaps early this spring), it should be possible to reduce some of the congestion on 2-meter metropolitan packet networks.

The modems are built around inexpensive Hamtronics FM-5 transmitter and receiver strips. The addition of a "data filter" in the modulator gives the FSK signal desirable spectral characteristics, while a corresponding circuit in the demodulator converts the data back to something that a TNC can understand.

Congratulations to Steve for spending the great amount of time necessary to design and debug the modems. The entire packet-radio community will benefit from his work.

Ed.

ACTIVITY ON THE UoSAT DCE

There has been a lot of activity with the Data Communications Experiment (DCE) aboard the UO-11 satellite this week. In preparation for a possible demonstration of the PACSAT store-and-forward "mailbox" concept, software for a prototype message handling system has been uploaded to the satellite. Monitor UO-11 bulletins to look in on the action.

Via NK6K.

HDLC ADD-ON AVAILABLE

Those of you experimenting with level-3 packet networking should note that a High-Level Data Link Controller (HDLC) add-on is now available for the Xerox 820 computer. This piggyback "FAD board" performs many of the complicated tasks involved in transmitting and receiving AX.25 frames. This development is particularly important because the ARRL Ad Hoc Committee on Amateur Radio Digital Communication agreed that the Xerox 820 with the HDLC add-on would be the standard computer system for level-3 software development and testing.

TAPR now has a limited number of the add-on boards available, intended primarily for those doing level-3 experiments. Each pc board comes with a parts list, a schematic, and a brief survival guide. All told, there are only 2 pages of documentation; this unsupported product is offered only as a service. Parts for the board are not available from TAPR at this time. If you are still interested, the price is $25.

Via WA7GXD.

220-MHZ DIGIPEATERS

Scott Miles, WB6PQM, is establishing two new 220-MHz digipeaters in the San Francisco Bay area. The new simplex machines will be running on 223.58 MHz, and are intended to serve the needs of RACES in Contra Costa county. The digipeaters will be based on GLB PK-1 TNCs.

Rich Collins, NT6V, reports that he and David Bly, WD6EVM, have installed a digipeater on 220.58 MHz in San Leandro, CA. This site, made available by the Alameda County RACES group, provides good coverage of the Bay area.

Via KA6M.

VADCG AX.25 DIGIPEATERS

Those of you who are using VADCG TNCs as digipeaters should be interested to know that Les McClure, W3GXT, and Mike Bruski, AJ9X, have fixed many of the program bugs that make these digipeaters fail regularly. In addition, they have installed some software and hardware timers which make certain that the program can recover from any faults that occur.

Mike and Les would like to hear what other groups around the country are doing with the venerable old VADCG boards. If you want a copy of their "bullet proof" VADCG AX.25 digipeater code, send an 8" SSDD disk to

Tom Clark, W3IWI 66388 Guilford Rd. Clarksville, MD 21029.

Via DRNET.

MAIL FORWARDING IN EASTNET

Several more stations have joined those capable of automatically forwarding and receiving messages via packet radio. In the Mid-Atlantic section of EASTNET, Gary Hoffman, AK3P, is operating W0RLI's MailBox program. From Gary's station in Hummelstown, PA, traffic is forwarded through 3 digipeaters to the W3IWI MailBox that serves Baltimore and Washington. The W3IWI MailBox is able to forward messages to WB2MNF in southern New Jersey. At a recent meeting, members of the Mid-Atlantic Packet Radio Council (MAPRC) agreed that "the linked PBBSs are providing a very ncessary communications conduit for MAPRC."

In the northern portion of EASTNET, Jerry Koniecki, WA2RKN, located in Hyde Park, NY, is providing MailBox service to stations from Long Island up the Hudson River valley. The W1AW packet bulletin-board system has been made fully compatible with the W0RLI forwarding software and is in communication with both WA2RKN and W0RLI (in Boston).

A long-standing goal of EASTNET is to link New England with the Mid-Atlantic. It looks like a well-placed station in Northern New Jersey would be able to

complete that connection.

For further information on the message forwarding protocol being used, contact Gateway or Hank Oredson, W0RLI.

Via W3IWI, Ed.

CENTRAL STATES PACKET NET

The Central States Packet Radio Users Group Net, sponsored by the Central Iowa Technical Society (CITS) has moved from 40 meters to 75 meters. The new frequency for the net is 3865 kHz, and the time remains 1500 CST on Sundays. The net will continue to discuss items of general interest to packet-radio operators, but will concentrate on discussions of linking and networking in the Midwest.

The first session of the net on its new frequency was January 13, and Ralph Wallio, W0RPK, reports that stations checked in from Michigan, Illinois, Iowa, and Nebraska. Experimenters from Nebraska would like to encourage stations from the Rocky Mountain area to check in, and stations in Illinois would like to hear from packet operators in Indiana.

Ralph suggests that Midwestern packet enthusiasts adopt 3865 kHz as an informal "calling frequency." Operators who want more information on packet radio, or who are having trouble with their packet equipment could just give a call on 3865 kHz and get their questions answered.

From W0RPK.

NTS NETS AND PACKET RADIO

Eastern Massachusets Section Manager Luck Hurder, WA4STO, adds these facts to the ongoing discussion of NTS recognition for packet-radio traffic nets:

"I was startled to see the article regarding NTS packet nets in the December 4 issue of Gateway.

"According to the article, the STM of the Southern Florida section has stated that monthly net reports are the key criteria for acceptance of a packet net as a NTS net.

"I certainly don't wish to be a wet blanket about all this;
please understand that I am an active packet operator. To be fair to anyone wishing to attempt to have their packet net become an official part of the National Traffic System, however, there are a few ground rules that must be taken into account. Some of them are:

"1. The Net Manager must be appointed by the Section Manager or his Section Traffic Manager.

"2. The Section net must adhere to section boundaries.

"3. The net must function on the basis of a prescribed, orderly traffic flow.

"4. The net must interface in a prescribed manner with the higher and lower echelons of NTS.

"Points 3 and 4 are the real stumbling blocks for a packet net. Regular interfacing to NTS is a chore! Stations must be available at prescribed times on a reliable, regular basis in order for the traffic flow to be effected properly.

"None of the above is to insinuate that a packet network cannot become officially affiliated with NTS. I just wanted to point out that a monthly net report is NOT the sole criterion for NTS affiliation."

From WA4STO.

DIGITAL COMMUNICATIONS BOOK

Gateway received the following book review from Pete Eaton, WB9FLW:

"While browsing through the bargin table at the local Radio Shack, I happened to glance at their rack of tutorial books. To my suprise, one of the titles was Understanding Data Communications. For the last several years, newcomers to packet radio have been asking for some introductory reference material written in plain language. Understanding Data Communications, developed and published by the Texas Instruments Learning Center, comes close to filling the bill.

"Each chapter introduces you to a fundamental concept in digital communications. Topics covered include an overview of data communications, data terminals, types of messages and transmission channels, asynchronous and synchronous operation, and satellite communications. "Of special interest to amateur packet operators are chapters covering 'Protocols and Error Control,' 'Local Area Networks,' and 'Network Design and Management.' A special treat is Chapter 9, 'Architecture and Packet Networks,' which uses X.25 as an example of a packet-switching network protocol.

"The whole book is written in clear, down-to-earth language. Once a novice has read all the chapters, I'm sure that he will better understand and appreciate the potential of Packet Radio in the Amateur Radio Service. If you are getting confused by all the talk of 'protocols,' 'LANs,' 'FSK,' 'PSK,' and 'level 3,' give yourself a present from Radio Shack."

[Remember that a thorough introduction to packet radio and several projects of interest to packet operators appear in the 1985 edition of The ARRL Handbook for the Radio Amateur. --
Ed.]

From WB9FLW.

PACKET RADIO IN JAPAN

Using a TAPR TNC as a debugging aid and compatibility tester, several Japanese amateurs are implementing their own TNC. The TNC will use a Z80 CPU and an 8273 HDLC chip. JA1MIR reports that JI1BXM is writing the AX.25 software for the TNC and that it should be complete by the end of January.

The Japanese group will be building an OSCAR 10 station to communicate with U.S. packet experimenters. They are particularly interested in internetwork (level-3) protocol development and high-speed modem research. Look for them on the satellite.

Takemi, JA1MIR, notes: "Designing our own TNC through understanding the AX.25 specification is great fun. I haven't been involved in such an exciting amateur-radio project for more than 10 years!"

Via NK6K.

PACKET RADIO IN ENGLAND

The following report on packet-radio activity in England was sent to us by Reg Brake, G8QR:

"In Norwich, there are now five stations equipped with TAPR TNCs. Those stations are G3LDI, G3PMQ, G4RSP, G6JTH, and myself. In addition, there are about fifteen local stations equipped with the software packet-radio program that runs on the BBC microcomputer. This program was developed by G6GIX and G8WJL at the Cambridge University Computer Laboratory.

""All of the stations equipped with TAPR boards have worked successfully on VHF. G3PMQ and I have also made contact with Ipswich. This activity is on 144.68 MHz, using 1200 bauds, 1000-Hz shift. In the last month, however, we have modified the TAPR boards to switch from wide shift to narrow shift at the touch of a button. The physical arrangement for this was designed by G6JTH and it functions very well. Since that time, we have been doing some HF packet operation.

"On 14.103 MHz, we made the first England-to-Germany packet-radio QSO, with DL2MDE. As I speak German, I initiated the contact, but both G3PMQ and I maintained an hour-long QSO with solid copy both ways. We have heard the American packet station [W0RLI] at 14.080 MHz, but signals were weak at the time, and we were not equipped with a tuning indicator. Since then, two stations have built the TAPR LED tuning indicator and use this very successfully on HF. We are looking for contacts on 14 MHz, although we are uncertain of the preferred frequencies. None of us is yet on OSCAR 10, so we are anxious for contacts on HF."

The winter copy of DATACOM, the journal of the British Amateur Radio Teleprinter Group (BARTG) contains a packet-radio column by Ian Wade G8NRW. In that column, Ian provides a list of about 60 stations active on packet radio in England.

If you are going to be in England this spring, note the following (also from

BARTG DATACOM): At the RSGB VHF Convention at Sandown Park on March 23, 1985, Ian Wade, of BARTG, is presenting a talk entitled "How Packet Radio Works." For more information contact

Ian Wade, G8NRW 7 Daubeney Close Harlington, DUNSTABLE Bedfordshire, LU5 6NF ENGLAND.

From G8QR and DATACOM.

SOFTNET WORKSHOP

The SOFTNET User's Group (SUG), in cooperation with Linkoping University, will hold its third SOFTNET Workshop on Sunday May 11, 1985, at Linkoping University, Linkoping, Sweden. Technical papers are solicited on high-speed packet-radio hardware and propagation, distributed routing in packet-radio networks, SOFTNET applications, and SOFTNET specification issues. Camera-ready summaries consisting of less than two standard A4 pages should be received by SUG by MAY 1st. Proceedings from the workshop will be available through SUG. For more information contact:

Per Lundgren SUG, Department of Electrical Engineering Linkoping University S-581 83, Linkoping SWEDEN.

The following is transcribed from Union Pacific System's FRIDAY A.M.,
a biweekly employee publication; this issue Jan 18, 1985. (A copy of this
was giwven to me by a co-worker -- I don't normally ever see this publication.)

8444 Begins Return Trip From New Orleans Jan 23

Union Pacific System will run its famous steam locomotive 8444 on a nine-day
tour this month through Louisiana, Texas, Oklahoma, Kansas, and Nebraska.

Nearly one million people viewed the locomotive when it was on display last
year at the World's Fair in New Orleans.

The trip to the fair was the first time 8444 operated in the South. This trip
will be its first appearance in Texas and Oklahoma. Much of the route hasn't
seen steam power in nearly 30 years.

The tour will begin January 23 near Baton Rouge, Louisiana, and end at Omaha,
Nebraska, on January 31.

Travelling on UP Ssytem's Missouri Pacific Railroad, the locomotive will make
overnight stops at Longview, Houston, and Fort Worth in Texas; Muskogee,
Oklahoma; Osawatomie, Kansas; and Kansas City, Missouri.

It will complete its trip to Nebraska travelling ovr Union Pacific Railroad
via Topeka, Kansas, and Lincoln, Nebraska. ... The train will travel during
daylight hours so as many people as possible can see it. ... The engine will
be on public display for a full day at Houston and Fort Worth and for most
of a day at Kansas City.

One of the unique features of the tour will be an on-board amateur "ham"
radio station. The station, with worldwide capabilities, will be manned by
Ed Askew and Hugh Tinley of the Ak-Sar-Ben Radio Club of Omaha. Radio
amateurs will be able to contact the train on most amateur frequencies.
The call sign for the station will be K0GHK.

Locomotive 8444 was the last steam locomotive built for Union Pacific Railraod.
It was constructed in 1944 and operated in regular service until 1960 when
it was saved for special excursion use. ... The engine will spend the rest

of the winter in Omaha at Union Pacific's maintenance shops where it is scheduled for major overhaul work. The locomotive is stored in Cheyenne, Wyoming, when not in use.

End of article

Hope this is of interest and it gets to you in time to be of value.

Will

Does this (the NJ law) mean that non-residents of NJ who are driving through with a scanner in their car and a ham license in their wallet CAN still be arrested if said scanner covers police frequencies?

Also, isn't it true that the Feds pre-empt the control of radio receivers and transmitters?

I am planning to finish my basement. I would like to use a combination
of fluorescent lights and incandescent lights with wall-switch mounted
dimmers. However - I am afraid that they cause interference with my
shortwave and medium wave radio reception.

Can one buy electrically quiet versions of these devices?
Is there some way to tame them?

Howard Katseff

Bob, thanks for the update, but your "Subject:" says "mobile scanner law",
and I don't see "mobile" anywhere in the excerpt you quote:

+---------------
| 2A:127-4. "Any   person   who installs   or has
      a short-wave

```
|    receiver  operative  on frequencies  assigned by the FCC for
|    fire, police, municipal or other governmental uses, is
     guilty
|    of  a  misdemeanor crime of the  fourth degree, unless a
     permit
|    therefor has first been obtained from the chief of the
     county
|    police,   or  from the chief of the police of the municipality,
|    wherein  such person resides.
+---------------
```

And I am just a little bit, no, a LOT concerned that this is just the tip of the iceberg, or the first slice of the salami game. Sure, hams are now a priviledged class, so that makes everybody in this newsgroup heave a big sigh of relief, but why should ANY class be so priviledged over ordinary people. (Note that there is no guarantee that the criminals this law is intended to deter are not hams... or politicians!)

```
+---------------
|    This section does not apply to   any  fire,  police,  or
      other
|    governmental  official of the state, or   of any county or muni-
|    cipality thereof, nor shall it apply  to  a  resident  of  New
|    Jersy holding a    valid radio amateur license of the Technician,
|    General, Advanced, or Amateur Extra Class."
+---------------
```

And what about NON-residents of New Jersey who are hams...? or just people driving through...? And non-ham residents, will they all march up and register like good little boys and girls? And what are the possible grounds for denying an applications for such a permit? ("No! You disagreed with me in town meeting last week!", or, "You haven't lived here 10 years.") Or will there be surprise raids of suspicious-looking antennas? Or of anyone who receives out-of-state mail from an electronics store?

Not to carry the extrapolation too far towards paranoia, folks, but I think once again our general civil liberties are being restricted on the (unproven) THEORY that such punishments deter criminals. Friends, I am not sure exactly what a "fourth-degree misdemeanor" is (not being a NJ resident), but it's surely inconsequential compared to the felonies such radios are being used for. Maybe more deterrence could be gained by making ANY use of a radio in committing a crime a "special circumstance" or something (as use of a gun is in California), that increases the penalties on conviction. Note: This does NOT make such use itself a crime (which could open up a whole host of other civil liberties problems), but merely adds "oomph" to a conviction.

IF (and this is a big "if", I'd want to see some documentation first) the use of scanners (receivers) IS a MAJOR crime problem in New Jersey, the much better solution would be encryption of critical services' transmissions, or conversion to digital transmission (possibly with voice compression and coding redundancy to actually improve S/N in marginal areas). (Plus such a "special circ." law.)

Not normally politically inclined, but suddenly worried by this new bit of
legislative not-so-trivia, I remain (not a ham),

Rob Warnock

Just mentioned on Radio Nederlands' Media Network program, 24 Jan:
Sony has a new, black-color model of the 7600D out, which has a "New,
Improved" sticker on it, and which incorporates the fixes for the SSB
instability & "pulling" problem. Their tests show marked improvements
over the old model. 2002's of recent manufacture also incorporate this
fix, but will continue to be available only in the silver color.

>From: dts@gitpyr.UUCP (Danny Sharpe)
>I opened mine up last night. All the wires are pushed in the holes
>firmly, BUT the middle duplex outlet was the only one that was connected
>to the green wire from the power cord. The result was that only two
>out of the six outlets in the power strip had their third holes grounded.

Ground wires don't necessarily have to connect to every socket. The
ground connection on an electrical outlet is CONNECTED TO THE METAL
MOUNTING BRACKET. This means that as long as all the outlets are
screwed into a COMMON PIECE OF METAL then they all share the ground
connection. Connecting the green wire to the center outlet sounds like
a good way of providing a ground for all of them.

All of the outlet boxes I have seen are either all metal or have a
front panel made of metal. So if the outlets are all screwed or
riveted to that common piece of metal THEY ARE ALL GROUNDED if any one
of them is.

Grounded outlets run in metal conduit don't connect a ground wire to
any of the outlets. The ground connection is made when the outlet is
screwed into the box. In case you are worried about how good this
connection is, remember that the mounting bracket is heavier than the
copper wire and secured by two screws. It is therefor a much better
connection than a single screw or push on clip.

FCC examinations sponsored by OMARC (Ocean Monmouth ARC) will be given at Ocean Community College. All exams, Novice thru Extra, will be given.

Dates: March 2 and April 6; both days at 1PM

Send a #10 business size SASE to:

Jim Grandinetti KZ2P
P.O. Box 106
Lakewood, NJ 08701

You will receive:

- A 610 form
- tips on filling it out
  (this is the new 610 form)
- a map with directions

The map should be enough but talk-ins will be on:

OMARC 145.110 - 600kHz

JSARS 146.910 - 600kHz

Suggestions:

- pre-registration is preferred

- you need to bring along TWO FORMS OF ID

- bring original license; photocopy is ok,
  BUT NO INSTANT UPGRADE WITH PHOTOCOPY

I suggest that you get in touch with the ARRL VEC Office,

ARRL/VEC
 - same address as in QST -

They certainly have all the information that you would need in that
regard. Also, the current ARRL "Tune in the World with Amateur Radio"
has the up-to-date question bank for the novices - or is it the
License Manual, but definitely one of the two.

Hope this helps,

Peter Baldwin, WA1SNH

The use of the conduit as the path for the ground, and not having a 3rd wire will not pass code in most U.S. cities. The reason that the mount tabs on a duplex outlet are connected to the third terminal (the ground terminal) is so that if THERE IS NO CONDUIT, as in the way most homes are wired, the rough-in box in the wall (plaster wall, dry wall or what have you) will be grounded via the duplex mount tabs. If this were not done, the box and the screw which secures the duplex cover could be HOT and zap someone, if the hot wire inside of the box had a bare spot and was in contact with the box. With the die stamped boxes and sharp edges, it is not uncommon to happen.

Since the manufacturer has no idea where the duplex outlets will end up, in a system with or without conduit, all are built alike, with the mount tabs of the duplex outlet tied to the third screw (for green wire). If your electrical system depends on the conduit and not a third wire, it is because someone cut costs but I would bet it does not meet code. The third screw was not put on the back of the outlet to hang in the air. If the outlet does not have screws, but has the holes to press the wire into, the same rule applies.

The third wire is required to pass code and if it is not there, it should not be UL approved, referring to your power strip of course.

CONVENIENT SOURCE FOR BEARCAT 20/20 MANUAL

Need a manual and schematics for the Bearcat 20/20 scanner? The Heathkit GR-740 scanner is really a Bearcat 20/20. Heath sells the GR-740 assembly manual with schematics for $5.

If you're considering a purchase of the Heathkit version, as recently reviewed in QST, be advised that the circuit boards are preassembled at the Bearcat factory. Consequently:

- If something ever goes wrong with an IC or a capacitor on one of the boards, Heath sells you an entire new board rather than replacing the component (now we're talking real money).

With all the recent talk on recommendations on portable shortwave receivers, I would like to hear some recommendations on good table top (non-portable) shortwave receivers. I am looking for a good general-coverage (~100Khz-30Mhz) receiver around the $500 range. I would like to stick pretty close to $500 as the top figure, but I would be willing to spend a little more if I find a receiver that is worth the extra money.

I am looking for a receiver with good basic performance (Good sensitivity, good selectivity, accurate digital readout, good stability, and reliable). It has been awhile since I have been involved with this hobby, and there are many new brands of receivers I am not familiar with. I don't need anything with lots of memory or presets, I just need good basic performance.

It seems there are three brands of receivers that are advertised quite often

in QST and Ham-radio magazine. Those brands are Kenwood, Icom, and Yaesu. I have heard that Icom has had reliabilty problems, but this is third-hand information.

Does anyone have any recommendations and suggestions for a general coverage receiver, keeping the above requirements in mind? Where is a good place to purchase a receiver these days??

Thanks in advance...

Dennis Gibbs

WARNING Any suggestions made below are for discussion purposes only.
No warranty or guarantee of safety is implied. Certain of the modifications discussed may involve hazards to persons or property, including possible fire or shock. It is assumed that in "net.ham-radio", these hazards are understood.

+---------------
| I am planning to finish my basement. I would like to use a combination
| of fluorescent lights and incandescent lights with wall-switch mounted
| dimmers. However - I am afraid that they cause interference with my
| shortwave and medium wave radio reception.
| Can one buy electrically quiet versions of these devices?
| Is there some way to tame them?
| Howard Katseff | AT&T Bell Laboratories - Holmdel, NJ

+---------------

The problem with taming incandescent dimmers is *POWER*; there's a lot of it floating around. When the dimmer is half-on, you are switching the full load current in a microsecond or two. If you have a total of 400 watts, that's a dI/dT of several million amps per second, which just LOVES to shock-excite any little resonances lying around in your wiring (120 times a second).

If you look inside your dimmers, you will see that most of them have (these days) a small hash filter, but it's usually a single L-C in an "el" (look for the heavy wire wrapped around some ferrite). They can't slow the fall-time across the SCR/Triac itself, since the ability of such a small beast to handle that power depends on spending as little time as possible in the switching transition. In fact, the L-C "filter" is really there to speed up the switching more than it is to filter RFI. [*DO NOT* try to add any capacitance across the SCR/Triac, unless you like to watch fires.] The trouble is, the hash filter itself radiates locally (due to the magnetic field?), and I have found that even when the dimmer is relatively "clean", strong broadcast AM (KCBS in S/F) gets RFI within several meters of the dimmer (and within a meter or so or the load wiring).

Solutions? Put the dimmer in a shielded box, and feed it with a commercial high-power RFI filter (in the wall of the box), the sort that are sold for computer switching power supplies. Watch out for leakage out the knob of the dimmer; you might want to replace/extend it with plastic. Don't worry about the load wiring. *CAUTION* Some dimmers will burn up if you put heavy RFI filtering on them, even externally. Using the usual precautions for working with live 110 volts, measure the steady-state temperature of the SCR/Triac with full load at half-bright setting (using a 'scope, it should switch on at the voltage peak -- your eyes can't estimate that well). Then install the RFI filter, re-adjust the dimmer (the RFI filter will probably change the switching point) let the system equilibrate, and measure again. Any additional temperature rise is cause for concern. As an added safety measure, derate the dimmer's power capacity 50% or more when using added filtering. Finally, check with the manufacturer!

Fluorescent lights aren't TOO bad by comparison, since the arc typically re-fires early in the cycle (once the bulb is warm), the ballast is a large inductor physically close to the lamp and in series with it, and the power is (usually) lower. Use the commercial "shop lights", with all-metal housings (and the ballast INSIDE the metal). In extremes, you might have to add more RFI filtering or grounded (to the case) mesh over the light, but I doubt it. When bulbs get old, they get "noisier" -- just replace them.

My overall suggestion would be to avoid using dimmers at all, but light your basement with several smaller lamps that you can turn on and off locally to achieve the desired lighting or mood. A single master switch near the door could retain the convenience of central control. (Most fluorescent dimmers don't work all that well, anyway.)

Nice try, as both a ham and a member of the volunteer fire deptartment
I am more than covered, but I'm still pissed off. Never before in
Americas history has radio reception been banned. Now in the wars
my grandfather modified shorwave sets to disconnect the transmitters
for people, but they weren't required to turn in the receivers. I feel
that the inanity law is even more cut and dried than Gun control. I find
out a good deal about what is happening in my town by listening to the
the police and fire frequencies.

If scanners are outlawed, only outlaws will have scanners.

As a matter of fact, the code here requires that not only the wire be
hooked up to the third screw but the box to be grounded as well, if there
is no conduit.

New Jersey overregulates everything. It has laws prohibiting:

-self service gas stations
-BB guns/BB rifles
-sparklers
-slingshots
-mobile scanners

I fled NJ in 1976, seeking refuge in the Midwest, and am now being harbored in Illinois, which prohibits none of the above (and requires no auto inspection!)

The best and easiest way to listen to Voice of America in Israel is to tune to 1260 KHz between 5 PM and 7 PM in the afternoon Eastern MediterraneanTime. VOA operates a relay station from Rhodes, Greece. If your friend in
Jeruselem would stop by the American Cultural Centre's library on King George Street (I forget the exact address, it's right before Jabotinsky if you're approaching from City Centre), he can get a full schedule of VOA's broadcasts for free. A more interesting experience is to listen to the US Armed Forces Radio and Television Service's relays of US network programmes (including "All Things Considered") at 11 PM local Israeli time on 15430 KHz. This has a very good signal to Israel.

Hope this helps,

Fredric J. Einstin
Digital Equipment Co.
Littleton, Mass
617-486-2497

P.S.
 The Israeli Armed Forces Radio station "Gailei Tsahal" ("Waves of the Israeli Defense Forces") used to operate a low powered relay station on 2442 KHz during the time that Israel held the Sinai desert. This relay no longer exists.

>Phil

Part of the catch-22 is that the examiner isn't supposed to discuss the test results with the applicant. If you remember the one that was ambiguous, you can probably discuss that question with the examiner.

In the case of the novice test, the test procedures are pretty lax. All you need to do is convince the examiner that you know the material; the examiner may even give an oral exam. So, if the ambiguous question is the one that caused failure, and you could convince the examiner that you know the material covered by that question, he can give you credit and pass you.

In the case of the tech to extra, the VE team has no leeway to give credit for missed questions. As a VE, I, at least, would be willing to discuss a specific question with an applicant and would forward your complaint to the VEC and FCC.

Of course, the applicant would also want to follow up on it vigorously, especially if that one question meant the difference between passing and not. Although the FCC and, possibly the VEC, might be able to waive a particular question, the 30-day waiting period would probably lapse sooner and you could re-take the test!

Also, ANYbody can write to the FCC at ANY time about ANY of the questions, or even propose new ones. The question pool is constantly being updated.

I am in the market for a new HF rig. The main features I am looking for are:

- Portability - not necessarily for mobile use - I am a coop student and my address changes several times a year
- Built-in general coverage receiver
- All solid state

A few friends have recommended the Kenwood TS-430S and I am presently leaning in in that direction. I would appreciate any comments about the TS-430S or any other suggestions or advice (nothing too trivial). (Please reply by mail).

qst de k9eui
hr propagation forecast bulletin nr 6   from arrl headquarters
newington ct february 10, 1985
to all radio amateurs bt

thus far in the month of february the solar flux has been 2 to
6 points higher than it was one solar rotation ago. the trend
to higher solar flux and sunspot numbers began in the middle of
january.   the author of these bulletins expects the trend to

continue through about february 14, keeping the muf slightly higher than it was in early january.

the earths magnetic field was active for several days prior to bulletin time. conditions were becoming more favorable in this respect, making for more stable propagation on all dx frequencies except 28 mhz, where still little more than marginal north south dx can be expected.

the propagation charts in qst will continue to be on the optimistic side, as they are based on much higher solar flux and sunspot numbers than we are likely to see for some time.

american sunspot numbers for january 31 to february 6 were between 25 and 9 with a mean of 18.1 ar

Tricking the ICOM R71A to Tune Below 100 kHz

Bob Parnass, AJ9S

The ICOM R71A general coverage receiver is designed for VLF reception down to about 0.097 MHz.

The following steps will confuse the microprocessor-based controller sufficiently to permit reception down to 0.0 MHz:

1. If all 32 memory channels contain frequencies, use the FUNC and CLEAR buttons to clear a memory channel.

2. Place VFO/M switch into the M (Memory) position.

3. Using all the manual dexterity you can muster, rock the Main Tuning knob back and forth, while simultaneously rocking the MEMORY-CH rotary control to switch back and forth between a memory channel with a frequency in it and a clear memory channel.

4. While manipulating both the controls described in the previous step, a frequency of 0.000.0 will appear on the digital display.

   You can now rotate the Main Tuning knob clockwise to tune up from 0.000 MHz to the frequency you want. Be careful: if you rotate the Main Tuning knob counter-clockwise, the radio will immediately revert to 29.999 MHz.

I used a Wavetek 180 sweep/function generator to verify that the R71A is indeed receptive to signals below 100 kHz. To make things easier, store the 0.000 MHz frequency in a memory channel for future use. That way, you don't have to use two hands every time you tune below 100 kHz.

From: Hank Magnuski, KA6M
Date: February 11th, 1985

Subject: Fourth ARRL Networking Conference - Corrections to preliminary info.

Some late-breaking information and some corrections require changes be made
to my preliminary information bulletin. Please modify the original document
as follows:

1) In the section on conference events, a room has been assigned and
session times have been aligned with those at the Faire.

 All technical sessions for the conference will be held in Room 232. This
 is in the East Wing of Moscone Center near 3rd and Howard.

 March 30th - 10:30 - Opening remarks and Keynote - Paul Rinaldo, W4RI
              10:45 - Pete's Packet Primer by Pete Eaton, WB9FLW.
              11:30 - Applications of Packet Radio - Papers
              12:00 - Applications panel session by Andy Cromarty, N6JLJ.
              12:30 - Lunch break. Location to be announced later.
               1:30 - Technical Papers on packet radio and digital communica-
                      tions. Presentations from the Proceedings, Part I.
               3:15 - Technical Papers on packet radio and digital communica-
                      tions. Presentations from the Proceedings, Part II.
               6:00 - End of technical sessions
               8:00 - Conference dinner. Location and price to be announced.

2) A voice coordination repeater has been approved.

Coordination Frequencies -- There will be packet radio activity on 145.01 and 146.58 MHz. Voice channel coordination will be on WB6FDT/R, courtesy of the Telephone Pioneers. Frequency is 146.19/.79 coupled to 443.1(out)/448.1(in).

3) An invalid electronic mail address was given.

Delete JOSE@PARC-MAX from the list of response addresses.

73, Hank

My feelings on portability is that it is not really a matter of which
HF RIG is more portable than any other (unless you DO wish to go mobile);
but rather, it is the ANTENNA that will make the difference.  There
are several different antenna types that will either go up indoors, or
will go up and come down smoothly.  These are something that I would
suggest looking in to for someone who moves around a lot.

There is a pretty decent book out by Dan Fox, W2IQD, Called "The
Handbook of Apartment Operation" that describes some of these
```

antennas. It is published by Foundation Publishing, PO Box 805,
Merrimac NH 03054.

I have no financial interest in promoting this book, although it is
one that I have read and think that it has some good advice to offer
in this regard. Also, one whould remember that "there is no free
lunch" - you pay for portability in performance.

PHIL,

I OWN A YAESU FT757 AND SUGGEST YOU TAKE A LOOK AT IT. THE KENWOOD 430
IS REALLY A DEFEATURED FT757. THE 757 COMES WITH BUILT IN KEYER, FM,
FILTERS WHICH ARE OPTIONAL ON THE KENWOOD. I AM VERY HAPPY WITH MINE.
YAESU HAD SOME START UP PROBLEMS WITH THIS RIG BUT THEY HAVE THEM ALL
CURED NOW--

Why does the VOA transmit on frequencies in the 40 Meter ham band? Does
anybody know if this constitutes a violation of WARC treaty or something?

I expect this sort of thing from the Russkies, but can't our own side
honor international agreements?

As announced on Glenn Hauser's SWL program "World of Radio"
on February 9, 1985, Kenwwod is discounting their hf receiver line.

R600 sale price $280
R1000 sale proce $360
R2000 sale price $440

Prices through dealers might be less, I do not know. This sale
might be due to the competition from Yaseau's new FRG 8800.

Subject : Review of Yaseau FRG 8800

A review of this receiver was done on the Radio Nederland DX
program "Media Network" on January 31, 1985. Comments were:

- Frequencies must be entered in two parts, first MHZ followed by a entering key function and KHZ followed by a entering key function

- sensitivity on 150 khz-25 MHZ is ok, but 25-30 MHZ is poor

- two filters 2.7 khz and 6 khz are standard

- compatable to the Kenwood R2000 with RIT installed

- no notch filters

- RS-232 port

- optional 118-174 MHZ converter and wide fm filter

  Hey, any of you remember the days when Dick Bash used to publish
"exam guides" that had pretty much all the questions and all the
answers to the tests ?? People used to get pretty bent out of shape
over whether this was ethical. Now the FCC does it, and folks have
even posted all the novice questions to the net. But now nobody
even thinks twice about it. I guess ham morality and hypocrisy
fluctutate, kind of like the solar flux. Why just the other day I
saw an ARRL Ham Morality Excitation Index Bulletin:

Through the rest of this cycle, scanners and pirate video topics
will rise in temperature, while local antenna regulation will
remain constant. Exam guides have cooled considerably while
jamming sustains its high level of interest.

Sporty's Pilot Shop has priced the AIR-8 at $270.

I'm tempted, it would sure be better than a "Walkman" at work!

Then again, maybe I should get a hand-held 720 so I can talk from
the Champ!

****

Somebody really ought to ask me how cheap the rates are at Wally
Olsen's Evergreen Airport in Vancouver, WA!

Cheers,

> Why does the VOA transmit on frequencies in the 40 Meter ham band? Does
> anybody know if this constitutes a violation of WARC treaty or something?

A long-standing bone of contention...

VOA maintains that since the broadcasts are *intended for reception*
outside of region 2, that it doesn't matter that the *transmitter site*
is in region 2.

Of course, you and I know what would happen if you tried to operate
SSB on 7085 to talk to a VK or ZL using the same rationale :-)

TAPR MEETING

I have just returned from the Annual Meeting of the Tucson Amateur Packet Radio Corp. (TAPR). Most of the "hotbeds" of U.S. amateur packet radio activity were represented at this day-long forum in Tucson. It was an exciting meeting: Several maps showing packet activity throughout the U.S. illustrated that packet radio is indeed growing rapidly. Last year, most people were worrying about stimulating packet activity in isolated areas; this year, the emphasis was on linking these isolated areas into a network. There were representatives from AEA and Heathkit, two of the commercial manufacturers who have "joined the packet-radio revolution." Perhaps the most exciting items demonstrated at the meeting were the 9.6-kbit/s modems designed by Steve Goode, K9NG. With these modems transmitting data eight times as fast as current modems, a truly multi-level network can be built. (In such a network, a high-speed inter-city link would handle long-haul traffic for several 1200-bit/s conversations.) That TAPR has supported and organized these projects proves that the group responsible for the most popular TNC is still helping advance the amateur-radio state of the art.

One of the purposes of the amateur radio service, as stated in Part 97 of the FCC rules and regulations is to "contribute to the advancement of the radio art." Unfortunately, for many years, commercial technology has been advancing more quickly than amateur radio. Presentations at the TAPR meeting, made it clear that amateur packet radio is advancing the state of the radio art. Both the U.S. Forest Service and Army MARS sent representatives to the meeting to find out how they could use amateur-generated packet-radio technology. Several speakers mentioned that their local Red Cross emergency operation centers are equipped for packet radio. In the west, where search-and-

rescue efforts must cover vast areas of wilderness, the Civil Air Patrol has begun to use packet-radio for search coordination. TAPR TNCs have even found their way onto military hurricane-investigation airplanes. Amateurs are once again contributing to the state of the art.

The TAPR meeting reinforced my belief that packet radio is bringing out the best in amateur radio. The technological advances demonstrated at the meeting and the interest in packet radio shown by Heathkit and AEA lead those present to conclude that packet radio will enjoy rapid growth in the months and years ahead.

Ed.

PACKET AND THE FCC

In late January, the FCC released Notice of Proposed Rulemaking (NPRM) 85-22, proposing to add definitions of "coordinated repeater," "frequency coordinator," and "harmful interference" to Section 97.83 of the FCC rules and regulations. The NPRM also proposes adding text to Section 97.85 concerning resolution of conflicts between repeaters. Complete text of this NPRM is available from the ARRL for an s.a.s.e. with $0.54 postage.

In a move that worried many packet-radio experimenters, the FCC stated that "during the pendency of this proceeding there will be a moratorium on new repeater operation in Central Metropolitan Statistical Areas and Metropolitan Statistical Areas." These areas include many growing packet-radio networks. Packet-radio operators are asking whether this moratorium extends to simplex digipeater operation on previously established or coordinated frequencies. Informally, FCC officials have stated that packet radio is not covered by this repeater ban. While no formal determination has been made, it is clear that the FCC did not consider digipeaters before placing the 9-month ban on new repeater installations.

On February 7, the ARRL filed a Petition for Partial Reconsideration, asking the FCC to drop the moratorium on new repeaters from NPRM 85-22. The ARRL sees both practical and legal problems with the ban. Part of the Petition for Partial Reconsideration reads: "the suggested moratorium comes at a very bad time in the evolution of packet-switching networks in the Amateur Radio Service which are dependent on repeaters for their operation. The suggested moratorium will place a chill on the development of packet repeaters and hence the communications experimentation which is presently at the forefront of amateur technology." The FCC should consider this request soon.

Comments on NPRM 85-22 must be filed by July 1, 1985. Since the proposed rule changes would have some impact on frequency coordination for packet radio, packet operators should be sure to comment on the NPRM.

Ed.

NETWORK COORDINATION

The recent FCC actions concerning repeater coordination underscore the need for packet-radio operators to work with local (and perhaps national) frequency-coordinating bodies. (For a discussion of such interactions, see Gateway number 11.)

On February 2nd, packet-radio operators from Northern New Jersey, Eastern New York and Connecticut met to discuss the formation of a Network Coordinating Agent (NCA). Those present agreed to form a NCA called the Tri-State Packet-Radio Council (TSPRC). TSPRC will be a council of packet radio clubs from the areas covered by the Tri-State Amateur Repeater Council (TSARC), a frequency coordinating body. All clubs within TSARC jurisdiction are invited to attend the initial meeting of TSPRC, at the Trenton Computer Fest, April 21st. For further information on TSPRC, contact:

TSPRC, c/o Jeff Ward, K8KA
52 Alden St., Apt. 202
Hartford, CT 06114.

Ed.

HEATHKIT TNC

Those lucky enough to attend either the Miami Hamfest or the TAPR Annual Meeting have seen the second entry into the "TAPR-clone" field. The Heathkit HD-4040 is a TAPR TNC in a brown and beige low-profile cabinet. Status-indicating LEDs are grouped on the left side of the front-panel, and the only switch on the unit is an ON/OFF switch on the right side of the panel. Inside, the HD-4040 is purely a TAPR TNC, complete with modem-configuration headers and AC power supply. The kit will sell for $299.99 and should be available by the second week in April.

The kit will feature an "improved" TAPR manual. Considering that the TAPR manual is one of the best seen in amateur radio, the Heathkit manual should be a superb document. Parts for the HD-4040 will come on an adhesive strip, in the order that they are required in kit construction. This packaging technique makes parts-list checking unnecessary, and should make construction go quite quickly.

The HD-4040 will bring two new marketing techniques to Heathkit: For the first time, the Heathkit TNC manual will explain how to connect a Heathkit accessory to non-Heathkit radios. Also, Heathkit will probably be selling the HD-4040 in a specially-priced package with another manufacturer's assembled and tested amateur radio transceivers.

Wayne Wilson, Heathkit's Product Line Manager for General Consumer Products, attended the TAPR meeting. Mr. Wilson believes that packet radio could breath life into the sagging amateur-radio industry. Heathkit is eager to build connections between amateur radio and computers, hoping that technically-inclined youth can be drawn back into amateur radio.

TAPR will continue to produce the TNC kit as long as there is demand for them. Most of TAPR's research and development funding comes from TNC sales. TAPR made the TNC available to commercial interests believing that packet radio is a field with room for more than one manufacturer. With nearly 2000 TAPR TNCs sold, they are being proven right.

Ed.

FOURTH COMPUTER NETWORKING CONFERENCE

The Fourth ARRL Computer Networking Conference will be held in San Francisco on March 30th, 1985. The conference, co-sponsored by the ARRL and the Pacific Packet Radio Society, will be held in conjunction with the Tenth West Coast computer Faire, which runs from March 30th through April 2nd at the Moscone Convention Center. The tremendous growth and interest in packet radio terminals, equipment, networks and applications promises to make this conference one of the largest and best-attended ever.

The conference schedule for Saturday, March 30th follows:

1000 - Introduction to Packet Radio
1100 - Panel session on Applications of Packet Radio
1200 - Lunch Break
1300 - Technical papers delivered
1800 - End of technical session
2000 - Conference dinner (price and location to be announced later).

Through special arrangements with the Faire and the ARRL, a special pre-registration fee of $20 will purchase a four day ticket to the Faire and the ARRL conference proceedings. Send a check for $20 and a s.a.s.e. to:

Hank Magnuski, KA6M
311 Stanford Avenue
Menlo Park, CA 94025.

The deadline for submitting papers for the conference proceedings is March 1st, 1985. If you need an author's kit, contact the ARRL.

Via KA6M.

WESTNET LINKED

The first reliable, 24-hour link between Northern California and Southern California was completed on February 3. In an amazing burst of energy, several digipeaters in Northern California were brought up in the last few weeks, extending the network 200 miles south. Coincidentally, a critical mountain range near Santa Barbara had just been bridged by amateurs from Southern and Central California. Until 145.01 MHz is allocated in Southern California, an audio link on 450 MHz connects the 145.01-MHz digipeater at Arroyo Grande with the 145.35-MHz machine at Santa Barbara. Eventual removal of this audio link will make the Los Angeles to San Francisco path a three-digipeater connection. Now, stations from San Francisco can use a six-digipeater path to connect with Los Angeles. For packet operators in California, the completion of this path is a milestone and an indication of better things to come.

For those keeping track of packet-radio DX records, the link between Northern and Southern California is approximately 530 miles long, and will be extended north another 100 miles soon.

Via NK6K, KA6M.

SOUTHERN WESTNET COORDINATION

The packet-radio community in Southern California has formed the Southern California Digital Communications Council (SCDCC). The purpose of this council is similar to that of groups previously formed in Northern California and the Mid-Atlantic States: to provide a single point of contact to the area frequency coordinating bodies and to serve as a clearing house for information and a forum for discussion of effective use of network resources. The first act of SCDCC was to petition the local two-meter coordinating body for allocation of 145.01 MHz as an inter-region packet linking frequency.

Membership in SCDCC is open to anyone with an interest in digital communication. All California packet-radio operators from Santa Barbara to the Mexican border are encouraged to join. The SCDCC mailing address is:

SCDCC
P.O. Box 6026
Mission Hills, CA 91345.

Via NK6K.

FREQUENCIES COORDINATED

The New England Spectrum Management Committee met on January 26, 1985 and made the following packet-radio frequency allocations:

2 meters: 145.01 to 145.09 MHz, for operation with less than 5 kHz deviation.

1 1/4 meters: 5 100-kHz channels between 220.5 and 221 MHz and 10 20-kHz channels from 221.00 to 221.18 MHz.

70 cm.: 10 100-kHz channels from 430 to 431 MHz and a single frequency at 441.00 MHz for 5-kHz deviation operation.

This allocation scheme follows a plan discussed at the Third ARRL Amateur Radio Computer Networking Conference and published recently in the newsletter 220 NOTES.

In Florida, the Florida Repeater Council has coordinated 145.01 MHz as the state-wide packet-radio frequency. In addition, they have coordinated 221.72, 221.78 and 221.40 MHz as 20-kHz channels and 220.57 for 100-kHz bandwidth operation.

Via K4NTA and AG1F.

NTS AND PACKET RADIO

Don Haney, KA1T, is running a packet-radio bulletin board system (PBBS) dedicated to NTS traffic. Don's PBBS guides users who are unfamiliar with NTS radiogram format through the message origination process. The PBBS is part of the growing network of W0RLI MailBoxes that are forwarding traffic around New England on 145.01 MHz. Don is looking for stations on HF to extend this network.

In the January issue of the NEPRA Packetear, Don writes that 110 pieces of formal NTS traffic went through his PBBS in December. Forty-five percent of that traffic was for delivery outside New-England and 35% was between the Eastern and Western Massachusetts. The balance of the traffic was for delivery in New Hampshire, Connecticut and Eastern Massachusetts.

If packet traffic is originated on a crowded channel or entered by keyboard, each message takes about 3 to 5 minutes -- longer than it would take to originate the same message on FM or CW. The advantages of packet radio are realized when the messages are being forwarded from computer to computer automatically. With automatic forwarding, messages can be passed at times that would otherwise be inconvenient, and they can be passed without introduction of errors.

VIA PACKETEAR.

MODEMS AVAILABLE

Jerry Quimby, N4AJH, is making available a limited number of PC boards for EXAR modems. Jerry is selling a finished PC board, parts

placement diagram, parts list, schematic diagram and tune-up instructions. The PC board measures 1 1/2 by 3 in., and can be used for either 300-bit/s or 1200-bit/s AFSK operation. If you are interested, send $8.50 in check or money order to:

Jerry Quimby, N4AJH
2677 Hereford Rd.
Melbourne, FL 32935.

These modems are already in service on some heavily-used Florida digipeaters, and the chips in the circuit are the same ones used in all of the available TNCs. Even though you must supply your own parts for the PC board, this is an inexpensive modem.

VIA DRNET.

TWO-PORT DIGIPEATER

If you want to link two packet networks that are on different frequencies, you may have to use complex digital and audio contraptions. Most of the available schemes involve auxiliary links between digipeaters on different frequencies, or single digipeaters that use audio mixing to communicate simultaneously on two channels. While these solutions to the frequency-translation problem work, they are not always the simplest or most efficient solutions.

A simple solution to this problem is a digipeater with two independent packet I/O ports and enough internal logic to route packets from one port to another. Jon Bloom, KE3Z, has written a program that implements such a digipeater. The software runs on a Xerox 820, using the serial I/O port (SIO) to send and receive packets. It has several mechanisms for routing packets from one port to another. The program resides in ROM, and is suitable for remote digipeaters.

If you are interested in this software, send an 8" SSSD disk to Gateway. In return, you will receive the software source, a schematic for necessary hardware and installation documentation.

Ed.

CORRECTION

In the item "12-V DC SUPPLY FOR TNCS" in Gateway number 12, there were two errors. The list of those who developed the power supply should include Don Brown, N0BRZ, and the item should be attributed to N0CCZ, not N0CCX. Sorry about that.

Ed.

PACKET AT HAMFESTS

Feb. 23 -- Midwinter Technology Fair, Fridley, Minnesota. Talk-in frequency 147.00/.60 MHz.

Feb. 23 -- ARRL Ohio State Convention, Cincinnati, Ohio. Packet forum at 1:00 PM.

Gateway is produced by the:

American Radio Relay League
225 Main Street
Newington, CT 06111.

My old Oscar Array blew down the other day and self-destructed.
Since I will be replacing it as soon as I can, I would like to
know what replacements are available. The old antenna never did
live up to expectations and I would like to do it right this time.
Any info will be appreciated. Thanks.

<munch!chomp!chew!nibble!crunch!smeck!eat! AHHHH! BUURRPP!>
Hello, this message comes to you from a soon-to-be-General-Licensee. My
question is: Under what authority is the VOA regulated? I cant seem to
find the answer in my ARRL handbook,FCC Rulebook, or Gen/Tech license
manual. If 40m. is allocated to Amateur Service on a Primary Basis in ITCU
reg 2 (as it appears in all 3 texts!) Then shouldnt the VOA be required to
utilize the band on a 'non-interfering basis' *provided* that they can use
the frequency at all?

      confused,

            Erik
ps-Some of the questions in the Part3 syllabus are FUNNY! I never thought
studying for my ticket would be so entertaining!

Regency MX-4000 Scanner Exists!

The first synthesized scanner to cover the 800 MHz frequency band is now available. I had a chance to try the new Regency MX-4000 at Erickson's Communications (Chicago) today. I'd have bought one instantly, but the $530 discount price is way out of line for this radio! Even the salesman cringed at the price, admitting it wasn't worth that kind of money.

Unlike the MX-7000, which has been advertised for about a year and hasn't yet been seen in public, the MX-4000 is more than a balsa wood and foam prototype.

My first impressions may be summed up in one word: 'peculiar'.

This 20 channel scanner covers the conventional bands, including the commercial aircraft band, plus the new allocations at 800 MHz. Too bad the coverage is not continuous, like the MX-5000, which affords coverage of military aircraft in the 200 - 400 MHz range, as well as the little monitored 72 MHz band. MX-4000 users may select between AM or FM modes on a channel-by-channel basis. Scanning speed seems to meet the specifications: 15 ch/sec. This is a welcome change over the MX-5000, that has a scanning speed several times slower than published specifications. (The spec sheets for the new HX-1000 and MX-5000 contain untruths.)

The speaker is on the bottom of the plastic case, which rests at an angle, due to a plastic foot on the bottom of the cabinet. This small scanner looks like a table radio, is billed as a mobile radio, but contains NiCd batteries! It's not shaped like a walkie-talkie, so don't plan on wearing it your belt.

The instruction manual, written in Japan, is scanty at best. For $530, you don't even get a schematic. An errata sheet is included, but doesn't fill in all

the
holes. The instruction sheet shows 2 antenna jacks on the back of the scanner. It looks like the manufacturer cheapened the design at the last minute and plugged up the hole where the SO239 was supposed to go, leaving only a single Motorola-type jack.

There is an odd slide switch on the front panel which doesn't appear in the pictures on Regency's sales literature. Apparently, this switch offsets the displayed frequency by 12.5 kHz, but the manual doesn't elucidate this.

The rather large LCD display is crisp, and contains several indicators. The 120 milliwatts of audio falls far short of what a mobile scanner requires. The scanner has to be operated with its slide volume control at the highest setting. Even then, it's difficult to hear well in all but the most quiet of rooms.

The MX-4000 contains another feature which no other Regency unit has: in addition to the ability to lock out channels from the scan list in the conventional manner, the user can set the scanner to scan between channels A and B, where A <= B, and A and B are between 1 and 20 inclusive. This is an odd way of implementing scanning in "banks". Instead of fixed banks of 10 channels, as in the Bearcat scanners, one essentially can choose his own logical bank.

I'm eager for someone, myself excluded, to buy one and rave about it. If the price dropped by $230 or so, I'd be more tempted.

Lakewood, NJ 08701

You will receive:

- A 610 form
- tips on filling it out
  (this is the new 610 form)
- a map with directions

The map should be enough but talk-ins will be on:

OMARC 145.110 - 600kHz

JSARS 146.910 - 600kHz

Suggestions:

- pre-registration is preferred

- you need to bring along TWO FORMS OF ID

- bring original license; photocopy is ok,
  BUT NO INSTANT UPGRADE WITH PHOTOCOPY

EGE, Inc, of Woodbridge, VA has the MX-4000 in stock now
for $399. (Phone (800)336-4799 for order information.)

The HX2000, a walkie-talkie shaped version of the MX-4000,
minus 30 - 50 MHz coverage, is expected by March.
EGE quotes a discount price of $359 for the HX2000.

to all new hamshire hams

My name is Pete Virgona N1DHD ex KA2KSR/1. Over the last year
I have been trying to get the New Hampshire Legislature to get
 pass a law to get ham plates at a
reduce rate. the current rate is $25.00 and it is clasified as a vanity plate.
We want to have the plates clasified as special plates and reduce the fee to
$10.00 for the first year then $5.00 for the rest of the time.
 Please send your letters to gov sununu at the State house in concord n.h.
 03301
to your local state rep and to Rep Phil LaBombardi W1OMZ , at
  60 Indian Rock Rd nashua n.h.

there was a bill intoduced in 1981 HR292-FN which was knocked down but
 I have gotten about 350+ petitions signed and sent to Gov Sununu and
 Richard Flyn Commisioner of Safety.

The time is getting near so your letter are a must!!

Please help our Cause !

I have the ARRL sending a letter also.

we need this.

Why should we have to pay $25.00 while national guard pay only $3.00??

thanks !

my node is FSLENG::Virgona
Home # 603 659-6294
Work # 617 938-2301

I do not know what my net node is.

so bear with me
As of today 2/18/85 there are two bills which are coming up to have a public
hearing I will keep you posted as to when it will be we need your support
on this so come out and speak your mind!!!!!!

> is used like SSB on hf.

"ACSB" is a trademark of STI (Sideband Technology Inc), the very same
guys who want to take our 220 mhz band. The acronym stands for
Amplitude Compandored [single] SideBand.

>
> Is a transmission of this type receiveable on a Kenwood R2000 hf
> receiver with the optional 118-174 MHZ converter using either
> LSB or USB modes ?

Yes, ACSB can be received on a standard SSB receiver, although not with
the same fidelity as the intended receiver. ACSB consists of an ordinary
SSB signal in which the audio has been compressed and a "pilot tone"
indicating the level of compressor gain has been added. The receiver
simply locks to the pilot tone (which has the side effect of providing

a stable frequency reference) and varies the gain of an expander amplifier
so as to keep the pilot tone at a constant level.

ACSB really works, particularly in marginal fading conditions like a
channel on Oscar-10. The extra gain during unvoiced speech segments
and higher average transmitter power makes the difference between being
intelligible and being mostly below the noise floor. Off-axis spin fading
is taken right out. Listening fatigue is considerably reduced because the
background noise almost disappears between syllables.

A couple of stations are beginning to experiment with ACSB on Oscar-10.
For more info, contact Vern Riportella, WA2LQQ, POB 177, Warwick, NY 10990.

Homebrew ACSB circuits are starting to appear in the ham magazines.

Phil

Net readers who are also radio hams may be interested in knowing that there is a Ham Torah Net called Mesivta D'Rakia (Heavenly Academy) which meets to study Mishna and Halacha on 3.825 Mhz daily (except shabbos) at 8:30 PM EST. The "Rosh Mesivta" is Rabbi Yitzchok Sokol (KA2B) in Lakewood New Jersey. The radio dimension adds alot to the discussions which are usually very friendly and stimulating. There are active and passive (no Ham license required to recieve) participants around the continent, and some silent listeners in Russia. This has been going on for several years and features special guest appearances from Torah personalities and festive get-togethers.

Another communications medium for Torah study is the telephone. Dial-a-Daf programs exist in major cities for studying a page of Talmud a day at a time.

Rabbi Sokol (who is also a master technician) has installed various dial-up Torah-tape classes in Lakewood, and Dial-a-Daf equipment in other cities.

Anyone interested in these activities, or in help or advice in setting up ANY type of media classes is invited to contact him:

Rabbi Yitzchok Sokol Phone:201-364-3382
676 9th Street
Lakewood, NJ

qst de k9eui
hr propagation forecast bulletin nr 7 from arrl headquarters

newington ct february 17, 1985
to all radio amateurs bt

instead of rising as predicted last week, the solar flux fell off slowly, from a high of 76 on the 10th to a low of 72 on the 14th, 15th and 16th. it then turned upward, to 73 on the 17th, but this is 18 points below the peak reached on january 20, when the same area of the sun was facing our way. that considerable active area seems to have run its course. it would have been visible for several days now, but so far hardly a trace of it has been seen.

some flux rise is likely during this week, but anything approaching the activity of january 16 to 23 seems unlikely in february.

if the solar flux remains in the low 70s, with no large day to day change, the high peaks of geomagnetic disturbance experienced in the second half of january will not be repeated. this will mean more stable daytime propagation on 14 mhz and lower frequencies. the 21 mhz band will be open for brief periods daily, but signals will be very erratic except on north south paths. long skip on 7 mhz and lower frequencies will continue to bother traffic nets that normally rely on these frequencies for reliable night time operation over relatively short distances ar

FAA on 283.0 Terrahertz

The highest frequency FAA allocation in government records dated May 1984 is for 283.0 THz. I don't understand all the information, but thought I'd post it for those in the know:

283.0 Terrahertz

Experimental Research Station
Atlantic City, NJ Tech Center

transmitter location coordinates: 392733N 0743428W

power: 2.5 megawatts
emission: 800M00P0N
equipment: neodymium

100 pps, 50 Mjoules/pulse, 20 sec pulse
3 milliradian beam width, Q-switched
aircraft retroreflector equipped

Note: This listing represents a use of a laser(s) for telecommunication purposes and it is entered in the list of frequency assignments to government radio stations for information.

I am currently requesting an antenna variance. The city where I live
has a 25 foot limit, and I am asking for an increase to 60 feet.
As you might expect, some of the neighbors see doom coming from
the sky in the form of lightning.

Can you recommend a text or paper that discusses the situation
when proper grounding of the tower is maintained? Any text would
be appreciated, but the lower the technical level the better.
Or how about something that uses lightning rods as an analogy?

Beyond that, any material you have used to obtain a variance
would be appreciated.

Please reply by mail ... tnxs ...

From the British publication WIRELESS WORLD, February 1985:

Pirate Navigation Interference Overcome

"Helicopter pilots flying to the North Sea oil rigs have found it increasingly difficult to use their navigational aids to locate the rigs. This is caused by pirate radio stations operating at frequencies in the medium waveband used by standard non-directional beacons. Racal Avionics have [sic] solved the problem by designing (within a month) a new non-directional beacon with a much increased frequency range...."

"...The transmitters are used as landing site locators or as route markers and the new design... allow[s] adjustable, reduced power outputs to be used from 100W stepping down to 20W. Because of the reduced power consumption, the beacon can be operated by solar, gas or wind generators at remote locations."

Here in the deep south, also known as "red neck country" we don't have
packet radio repeaters, on-the-air BBoards, etc. In fact, we are
just getting into computerized RTTY.(No jokes please, it's a bad situation).

I am trying to get some interest up here in Montgomery Alabama, in using
our computers (almost every ham has one now) for hobby; research; public
service; etc., and need some info from the rest of the ham community.

How does a club get into packet switching, what cost, what equipment is
needed, what programs available, etc. The whole gammet (sp).

That part out of the way, how about some programs for such computers as the
C64, VIC 20, IBM-PC, CoCo, Timex, etc. Is there a repository somewhere
within info-hams that has such programs (logging, duping, beam headings,
circuit board design, etc). If I could get hold of such programs and info
I can get some interest generated. Altho' Montgomery is "a hick city (?)"
we do have some of the finest computer talent around. We have the
Data Systems Design Office (USAF) where I work, with 11 large mainframes,
16 Mini's, and over 3000 micro's available. We also have the Air Force
Air War College where all the prof's get formal military training. We have
a very active Red Cross (ham wise) as well as Civil Defense (state, and county),
and I can see the need for computerized traffic. Many hams are NTS inclined,
as well as local net liaisons, and mostly, we have our share of disasters.

Any info, programs, hints, nasty remarks (not really) will be much appreciated.

Mucho thnks in advance.

73's Walt WA4YCM (Central Alabama Dstrict Emergency Coordinator)

Walt,

I can't help much with your question about logging, beam heading or board design programs. But I can chew your ear off about packet radio at any length you want.

The basic setup of packet radio as it has evolved so far is that each ham has a terminal or a little computer with a terminal emulator program, and he has a TNC (Terminal Node Controller) and a radio, usually 2 meters but also HF and other VHF bands.

The TNC is a single board computer with a modem, transmitter control, serial ports, protocol and so on all ready to go. The hookup is literally a terminal on one side (DB25 connector) and three signals to the radio on the other side, namely transmit audio, receive audio and push-to-talk. TNC's are available from TAPR, GLB, AEA, and some others, and according to the Gateway that just came out, they will be available from Heathkit.

Most packet radio operation is simplex (145.01 MHz on most of the East Coast). To get farther than your own neighborhood, you relay through other stations, also on the same simplex channels. Your TNC allows others to relay through you. This is called "Digipeating". Typically, a club will put up a digipeater at a good site and everybody can digipeat through it or go directly to those in their neighborhood.

The thing that comes as a surprise to most 2-meter operators is that a dozen or so QSO's can be going on at once, all on the same simplex frequency, without interference. This is because each station sends only an occasional short burst of data when the operator finishes typing a line. Most of the channel time is idle. If two stations happen to transmit at once, so that a transmission is lost in the QRM, the protocols in the TNC take care of re-sending the packet until it gets through.

To keep interest up in the area, it is good to establish a Mailbox or Bulletin board system. Most of these (about 25 and climbing) are based on the Xerox 820 boards that were available a while ago. They use software developed by Hank, W0RLI. Many of these are linked together by HF on 20, 30 and 40 meters. I have posted the W0RLI software on SIMTEL20. (It's about time to send an update, now that I think of it. The new features of automatic mail forwarding among BBS's aren't in the current one on SIMTEL20.) Hank's software has been mentioned in Gateway and 73 magazine.

I'll cut this message short here. Let me know if I can expand on any of this for you. I guess I'll CC: this to info-hams, too. Anybody on the list who wants to chat about Packet Radio and packet BBS's, please do!

73,
Bob Clements

What is the proper configuration for hooking up an MOV to a power
line? (i.e. in series or in parallel?).

If it hooks up in parallel to the power line, why wouldn't one MOV
work for your entire house? It seems that it would, because all the
lines in the house are connected to together in parallel.

I finally got around to looking at that list of Novice questions
and answers that was posted here a while ago.

My question is: Where did the answers come from and why are there
a bunch of wrong answers (or am I going crazy)?

> Question 2A-20.3 asks what the prefixes are for callsigns assigned
> by the FCC. The given answer is "AA to AM, K, N and W".
> But "AM" is wrong. The right answer is "AA to AL, ...".
>
> Questions 2A-23.1 through 2A-23.8 deal with identification. The
> key question is 2A-23.3, "Do the FCC Rules require an amateur
> radio station to identify at the beginning of a transmission?"
> The given answer is "Yes". But the real answer is "Unfortunately,
> no. This requirement was dropped a while back when identification
> requirements were relaxed. At this time, the requirement to
> identify the party with whom you are in contact was also dropped."
> All the other questions about "How many times must you identify..."
> are wrong, since their answers say you need to identify at the
> beginning.

I haven't gone through the whole list, so I don't know how many other
errors there are.

Does anyone know the source of these answers? Am I wrong about any of
the above? I was going to give a copy of the list to a prospective
amateur, but I think I'd better not. Or at least tell him that he
shouldn't trust the answers.

/Rcc

Walt,

The Red Cross in Palo Alto has committed pretty heavily to the packet radio system produced by the Tuscon Amateur Packet Radio (TAPR) group. TAPR has a board (a "Terminal Node Controller," or "TNC") that comes as a kit for something like $300. Heath has just announced their own kit version of the TAPR design for the same amount, I believe -- see this month's 73 magazine. The TAPR TNC's are professional-quality design, good-looking, and work like a champ. One end plugs into your radio (usually your HT), the other end plugs into your computer terminal (or your home computer running a terminal emulator program), and you're on the air. Done. Sit down and type; QSO in progress. Since you say your guys have home computers already, all they need is the TAPR or Heath "Terminal Node Controller" and the program that lets their PC act as a terminal to another computer.

There are other vendors of packet systems, perhaps most notably AEA (who makes an assembled version of the TAPR board for five or six hundred dollars) and GLB (which makes a low-end system with much or most of the TAPR TNC's capability for fewer dollars.)

We have put together a complete package for our own (Red Cross) use in a single aluminized attache case that includes a small Texas Instruments terminal with thermal printer, a TAPR board, and a 2-meter HT; you can carry it in one hand. (It does require 120 volt AC; we're working on a 12-volt version.) It's pretty straightforward to assemble this sort of package, if you decide you need it for Red Cross disaster services operations. We have also used it for Simulated Emergency Test, the county-wide Medical Exercise, and other drills, and we've learned a lot about how packet can be used for emergency applications (including the problems it doesn't solve). Overall, it's a very impressive thing for a fire marshall or police chief to be able to *see* printed radiograms being sent back and forth between emergency stations -- it usually beats anything they have at their disposal for disaster communications hands down.

The next step is to put up repeaters in your area, once local hams can converse via packet. This is a least as easy as putting up a regular two-meter repeater. As a matter of fact, every TAPR board *is* a repeater (a "digipeater") without you doing anything special to it, at the same time that it's your personal TNC, so you can get along for a while without installing special high-level repeaters in your area if everyone is within 2-meter FM simplex distance of the next guy. Most of us who work for the Red Cross leave our stations on the air 24 hours a day as digipeaters; if I want a QSO when I get home from work at night, I just sit down at my terminal

and type -- everything's all warmed up and on the air. In many cases
you can extend you range by going through existing duplex 2m FM
repeaters; some of us do this now in the San Francisco area.
It's not optimal, but it often works.

The problem of how to link into the existing National Traffic System
is being worked on. Suffice it to say that we aren't there yet.
The currently implemented approaches are, unfortunately, "think
small" approaches, and we still lack a good model of what such a
system should look like on a national scale and what its high-level
protocols should be. There are some systems in place now that
provide a limited capability for NTS traffic passing via packet,
mostly in the Northeast; they suffer from the disadvantage of being
utterly ad hoc but offer the advantage of giving people exposure to
the idea of traffic-via-packet now. (Admittedly an opinion, but I
design and build distributed artificial intelligence systems for a
living, so I allow myself the luxury of holding such an opinion.)
Some of us here on the west coast (emergency comm people, traffic
handlers, and packeteers) are working on a general solution to this
problem that can be implemented on a national scale. (Anyone who's
interested is more than welcome to participate in the design process,
by the way; there are a lot of hard problems to solve before we're
all linked together -- it's not just a matter of more repeaters and
more mailboxes -- and we need all the good networking ideas we can get.)

Good luck & 73,
                    Andy N6JLJ

ACSB sounds a lot like LINCOMPEX - a modulation scheme used
in radio equipment made and sold for years by Standard Telephone

and Cables in Britain. I understand it is sold mainly for
diplomatic (embassy) communications equipment all over the world.

ACSB is Amplitude Companded Single sideBand or something like that.
As near as I can tell, it is very much like the SSB widely used on the ham
bands these days by speech processor afficionadi, except that the receiver
has a provision for expanding the dynamic range again, so it shouldn't sound
quite so awful on receivers so equipped. If you listen with your Kenwood,
it should be perfectly intelligible, but probably would sound like someone
running a lot of compression (which they are).

According to some of my old cohorts at Motorola, ACSB is nice in theory, but
loses out to FM (which they conveniently happen to be able to supply from
their standard product line) in urban environments where the real limiting
factors are adjacent-channel interference, intermod, multipath, and all those
things that don't show up in the academic investigations of SNR in FM versus
ACSB systems. Clearly, Motorola has an axe to grind, but they also have a
whole lot of RF systems expertise and actual experience with urban
environments, so their opinion should be considered very seriously before
everybody converts madly to ACSB!

I have a Kenwood TR-7950 in my '84 Honda Accord LX hatchback.

I mounted the rig under the center of the dash, by rigidly bolting the "quick-release" mounting bracket to the underside of a small plastic panel underneath the lighter/ashtray/cruise-control stuff. The mike hangs on a plastic hook (kitchen-type dishtowel or potholder hook) glued to the front of the ashtray.

This works fine, except that vibrations from the road cause the rig to vibrate -- resulting in "squeaky-creaky" sounds as said small plastic panel jiggles slightly. Obviously, this particular panel was not intended to bear any kind of load (least of all a TR-7950 attached to it!).

I tried wrapping electrical tape around the little plastic tabs that protrude from the plastic panel and hold it in; this dampened the noise a bit, but not much.

Mounting the Kenwood in the dash, in place of the AM/FM radio, is out of the question: it won't fit, and in any case I like to have an AM/FM radio in my car! (Please, no flames about car stereo quality.)

Does anyone have some better idea I might try (either some way to damp the vibrations, or some other place to mount the rig)? Most appreciated would be case histories from people who have actually mounted a TR-7950 (or similar rig) in a Honda Accord (or similar car) -- but I would welcome any input.

Mail directly to me if possible; I will summarize to the net in a couple of weeks.

I think the recent answer about ACSB Amplitude Compandered Side Band
missed one point. As far as I can tell, a pilot carrier is transmitted
in ACSB. This makes receiver afc/lockon possible - which would seem to
be needed at UHF (no tuning dial, wide temperature range). Thus reception
on a ham receiver might turn up "poor carrier suppresion" (or a
whistle if the pilot has been chosen above the intended audio range).

  If it hooks up in parallel to the power line, why wouldn't one MOV
  work for your entire house? It seems that it would, because all the
  lines in the house are connected to together in parallel.

Joe "

The MOV is a shunt device: it has a high impedance until a transient causes a large voltage to appear across it, at which point its resistance becomes small, or more precisely, it prevents the voltage from getting much bigger by shunting a large current through the MOV.

To protect equipment with MOVs connected to the AC line, you would want to choose an MOV rated for a voltage which would not NORMALLY appear across the line. Be sure to find out (does anybody know?) whether the MOV is rated in terms of instantaneous peak voltage or RMS line voltage. The peak voltage is sqrt(2) times the RMS value of 115 or 120, thus about 170 volts. To allow for manufacturing tolerances, an MOV which limits peaks to about 190 or 200 volts would probably be about right.

Another parameter you need to choose is the maximum shunt current you need to handle in the MOV. The right choice depends on the application. For EMP protection, FEMA recommends a rule of thumb of 25 to 120 Amps per FOOT of exposed conductor if the conductor is vertical and 5 to 10 Amps per foot if it is horizontal. In either case, a practical limit would occur at about 2000 Amps because more than that will arc over around even your MOV. So probably a 2000 Amp peak current rating would handle most transients in the real world. I'm not sure just how LIGHTNING transients would differ from EMP, but it is generally claimed that the risetime is longer (slower) for lightning. I suspect that the above rules of thumb for EMP would result in a conservative design that would handle lightning nicely also.

The MOV would be connected across the line (in parallel, in your terms). A single MOV at the power entrance point would be very useful if all wiring beyond that point is in metal conduit. However, note that MOVs may become ineffective after being zapped a couple of times, so it might be well to install several of them in parallel at the entrance point. It is also a good idea to inspect or test them periodically.

Bear in mind that both EMP and lightning are fairly wideband phenomena, EMP particularly extending well into the VHF region. Because they are so wideband, they act like (they in fact ARE) radio waves and can get picked up by even a few FEET of conductor betwee the "central" MOV and the device in question. MOVs at various other points in the system would provide better protection to specific (expensive) equipment especially if the entrance-point MOV(s) failed or if the distribution wiring in the building is not shielded.

The LEAD LENGTH and inductance in series with the MOV will greatly reduce its effectiveness in limiting voltage peaks. It is best to use techniques similar to those used in building VHF/UHF amplifiers: very short leads, wide "straps" rather than ordinary wire, or else large diameter conductor, avoid bending the conductor (because bends introduce inductance) etc.

Additional protection can be provided more locally by using Zener diodes on low-voltage lines and gas gap devices on antenna feedlines. NOTE THAT AIR GAPS ARE NOT EFFECTIVE against EMP transients because the risetime is much faster than the time required to ionize air. Buy a gas discharge device

specifically designed for EMP or lightning protection, and then check it
periodically (after every major electrical storm, for example).

I hope the above is helpful. Please note that I am only an "instant"
expert on this subject rather than a "real" expert, so I may not be able
to give you much more detail than the above. However, I would be glad to
try to answer any further questions or point you at someone who can do so.

I've never seen much use for the special 'temporary' call signs -
eg the "AB2IAU" that I could have used (but didn't) during the US Bicentennial
in 1976, although I think special event calls like WF5AIR (a call used for
a station at a fair a while back - I don't remember when but it was written
up in QST sometime in the 70's) are appropriate for special stations at the
events - as are the commemorative QSL's they generally provide. I also think
the FCC should allow club stations to apply for calls that reflect the name
of their organization (if the call is unassigned), e.g. Southwestern State
College (not intended to be a real institution) might ask for somthing like
N2SSC.

Anyone heard any air-to-ground telephone conversations yet?
Here's a start:

Illinois Bell Telephone, domestic public air-to-ground
                      [Illinois]__________ 454.6750____KSC881   (govt recds)
              "   [Illinois]__________ 454.9500____KSC881   (govt recds)
unidentified: air-to-ground telephone, only the aircraft side of conversation
                      heard, strong signals 12/3/84
                      [location?]__________ 459.9750_mo_callsign? (B. Parnass)

Wanted:

Want to buy set of paddles for an electronic keyer.   Will consider
purchase of keyer too if it's cheap.

Please reply by phone to Tigard, Oregon (503) 639-9847.

If it is long distance, you're too far away.
Thanks WA7VAG

Well to change the subject from CB/Ham debate. I am interested in
getting involved in PACKET RADIO. I understand there are 2 different
boards on the market. The GLB board which is a hardware/software
implementation of AX.25 and the TAPR board which is a true hardware
implementation.   The difference is about $100 with the GLB board
being the cheaper of the two. Is there any particular reason to buy
the TAPR board over the GLB board. Has anyone had any experience
good or bad that they would like to share with the rest of the world.
Most of the information on PACKET RADIO in the ham press revolves around
the TAPR board. Is there any reason for this?
     I'm sure that there are other hams, like myself, how would be interested
in getting involved with packet radio but don't want to make a mistake
and buy the wrong hardware. So lets hear from some of the "experts" in
the field.

thanks,

/bill

A friend has a Uniden EX-3100 cordless telephone that has a "CMOS latchup"
problem. Every couple of days, the base unit quits working, necessitating
unplugging the power and plugging it back in to restore proper operation.
I'm guessing that it is caused by his archaic telephone switching office's
transients & glitches. He has exchanged the unit-- same results.

Has anyone else had similar problems with this or any other model cordless
telephone? What have you done to solve the problem? A transient suppressor?
Details?

Suggestions?

Thanks,
  Bob

I recently became interested in packet radio and would like to
read some books to inform myself about this. I am computer literate
and used to interface my IBM PC with my transceiver for hf rtty, so
I don't need anything explaining the basics of computing or computer
communications. Any recommendations will be appreciated. Please
reply to me and I will summarize to net.ham-radio. Thanks!

AO-10 RTTY Format Delineated

On 3 Sep 84 a new beacon system was implemented on AO-10 which
included for the first time an RTTY transmission. This signal
coded key spacecraft operating conditions in a format convenient
for many Amateurs not equipped with the PSK decoders used by the
command stations and a fortunate few others. Now comes word on
how to decode the RTTY telemetry being heard both on Mode B
(145.810 MHz) at 15 and 45 minutes past the hour and on Mode L
(436.040 MHz) at 0, 15, 30 and 45 minutes past the hour.

According to command station VE1SAT/VE6, the so-called "Y" block
sent as RTTY is a version of the "Z" block telemetry send via
PSK. Thus many of the key operating parameters are now
available for general consumption to anyone who has 45 baud
baudot RTTY demodulation and display capability.

The exact baud rate is 50 rather than the 45 baud (60wpm)
standard but most electronic and mechanical machines equipped to

receive 45 baud will respond well to 50 baud. The AO-10 RTTY telemetry is sent in FSK with 170 Hz shift and is standard baudot (5-level) coded.

The following table provides the key to understanding the transmitted information about the spacecraft operating conditions. The parameters are organized and transmitted as six rows of ten columns. For convenience we will label the rows "A" through "F" and the columns 1 through 10 thus:

	1	2	3	4	5	6	7	8	9	10
A										
B										
C										
D										
E										
F										

Each of the 60 telemetry cells or channels is sent as a 1, 2 or 3 character numeric group such as "0", "16" or "165". Each block of 60 is preceded by a narrative, the decimal date (day zero equals 1 Jan 78) and several hexadecimal numbers. Your key to knowing when the block of 60 begins is to watch for a long series of space characters followed by numerous carriage return/line feed sequences.

for sale to a good home.

TAPR KIT board with TAPR snazzy cabinet.

This is a brand new kit board and cabinet
that I just put together. It has been fully
tested and checked out. Buy this from TAPR in
kit form and pay over $325. Buy it from me
and I will put it on your doorstep (UPS) for
the same price assembled and fully guaranteed.

TAPR BETA board in Ten-Tec cabinet.

  This is the board that TAPR put out for system
  test of what became the kit board. This board was
  assembled in Tucson by the TAPR folks and I put it
  in the cabinet. With full documentation and delivered
  to your door (UPS) $175. Fully guaranteed

why am I selling some of my packet stuff? i need the money.

x
      New 800 MHz Handheld Scanner in the Works?

Look for a future announcement by Regency of the new HX-2000
handheld scanner. Rumor has it that this radio   will include
coverage of the   800 MHz land mobile band, as well as
      the
traditional public service bands.

I may be a while before you can get your hands on one. When
Regency announced the HX-1000, it took over a year to get it
onto store shelves.

A friend of mine just got the MBA-TOR rtty package from AEA. He soon
found out that it will NOT work with the Kantronics interface (TU).
He is using the Commodore 64.

There are a couple of signal lines that are inverted in a couple of
the states: rtty data is inverted in the send-space mode, and cw.id
is inverted in the send-mark mode.

I solved the problem by decoding the leads from the Commodore 64
with a 74LS138 and then re-creating the proper outputs with a
74LS00.

If anyone out there has the same problem, I will be glad to furnish
the details.

The folks at AEA said "just invert one lead" and were not sympathetic.
I guess that because the cable furnished will fit, they think that
makes it "compatible"!

The problem with CMOS is that there are many P-N-P-N structures between
Vdd and Vss. As most of you know this is a SCR (Silicon Controlled
Rectifier) Structure, and is quite sensitive to High dV/dT (transients).
I would suggest putting a small capacitor across the line. The impedance
of a telephone line is 600 ohms, so the reactance of the capacitor
should be quite a bit higher so that it doesn't attenuate the high frequency
components. I would try a cap that gave 1K ohm at 5khz,

    Xc = 1 / (2 * pi * C) ... === 31 * 10 ^ -9 Farad.

Which sounds a little high... maybe start with .001 micro farad and then
try moving up to to the .031 micro farad cap. Remember that the ring
voltage is 90v p-p supermiposed on the 45v dc that is normally on the
line. I forget the frequency, but it is below 1000 hz (20 Hz?). Anyway,
your cap shouldn't be polorized, and should be good for 200 V.

I trust your friend is on an old step-by-step Central Office... I think
capacitors on the line would probably confuse a modern CO.

With regards to Latch - Up, (plug time) we have some people doing interesting
research that will predict latch up paths in VLSI circuitry. It is a
difficult problem for CMOS designers since Latch - Up is a very large
problem yet one which still has to be check for manually (i.e. look
at the I.C. masks and identify the suspect P-N-P-N between Vss and Vdd).
A grad student here has modified a circuit extractor to Identify these
paths and analyze them for latch-up susceptibility. Very nice.

                  Kevin

I'm looking for references to a good scanner presently
on the market. If you reply, please let me know WHERE
you found the best prices.

Preferred features:
1) 12vdc/110ac operation
2) covers most widely used freqs
   (that 30MHZ-2.N GHZ looks nice, but too expensive!)
3) Can be altered to take external digital input.
4) Will do "sweeps" from one freq to another.

All of the above are preferences. I still want to hear
both good and bad reports on all scanners that people have
used out there.

     Thanks,

     Gary

[eat me]

I've said this before and you all are probably tired of hearing it, but if the word CB is mentioned then the majority of the Amateur Radio public will sneer and jeer. This may be quite appropriate but it doesn't sit well when you hear it again and again. I only consider CB as a radio and not a mentality. Doctors do the same thing as Hams by sneering and jeering at chiropractors (sp?) and thinking that they are better than them. When in truth both of them can be justified. It's common to think of yourself as being better than the rest because you had to study more or had a tougher exam. I used to think I was better because to learn how to fix a radar took 37 weeks and to learn how to operate it took maybe a fourth of that. So me and my co-workers would sneer and jeer. It made us look bad, it makes you look bad and is considered unprofessional. When CB was proposed, the Hams formed an action commitee to ensure that CB is where it is in the spectrum and to ensure that it would fail. I think if the Hams welcomed the CB'ers to a UHF or even VHF spectrum they would themselves prosper. I always think of the radio's that are used on 10 meters now, and probably why 10 meters is such a success is due to being able to buy a CB radio, easily convert it enjoy. By welcoming the CB'ers to UHF we could expand 10 meters and also get new radios for UHF and build up that band. God knows there aren't enough Hams up there to attract a manufacturer.

From Radio Communications Report (International    Thomson
     Com-
munications, Inc.) December 3, 1984:

            GE WITHDRAWS PRCS FROM FCC

   SYRACUSE - The General Electric Co. has anounced it  will
   no  longer  pursue development of its personal radio com-
   munications service [PRCS]......

   The corporate move comes surprisingly close to an  expec-
   ted   FCC  rulemaking    on a proposed allocation of spectrum
   for the PRCS    and a variety of other newly proposed servi-
   ces.   GE was  seeking  4 MHz of spectrum (898 - 902 MHz and
   937 - 941 MHz) from the land  mobile reserve spectrum.....

   The proposed    radio service received mixed reviews  within
   the   land  mobile  radio  industry, with comments ranging
   from  "a poor  man's cellular"    to a sophisticated  citizens
   band  radio.

   GE's  PRCS was actually a little of both.  It   proposed  to
   offer low-priced two-way communications with    the capabil-
```

ity of interconnection to the public switched telephone network. The proposed service was expected to have a range of 5 miles up to 15 miles with a repeater.....

Mura Corp. is also seeking FCC support for a "consumer radio service" using 900 MHz land mobile reserve frequencies.

--

Phil,

Could you reply to this, so that I can get the 'path' to you.

Thanks,

Paul KW7Y

The idea here is to create yet another prefix, so that prefix-hunters
have something new to hunt. This assures that the operator of the
commemorative station will have plenty of QSO's.

Ever wonder what those non-amateur stations are on 75/80 meters?
Here's a start:

```
Continental Air Lines, aero/fixed

TWAS THE NIGHT BEFORE CHRISTMAS, WHEN ALL THROUGH THE SHACK,
NOT A METER WAS STIRRING, NOT EVEN ON THE RACK,
THE FINALS WERE HUNG BY THE CHIMMNEY WITH CARE,
IN HOPES THAT ST. NICK WOULD TUNE THEM RIGHT THERE.

THE CHILDREN WERE NESTLED ALL SNUG IN THEIR BEDS,
WHILE VISIONS OF MOONBOUNCE DANCED IN THEIR HEADS;
AND MAMA WITH HER HANDHELD, AND I WITH A TRAP,
HAD JUST SETTLED OUR BRAINS WITH A HIGH VOLTAGE ZAP.

WHEN OUT ON THE TOWER, THERE ROSE SUCH A CLATTER,
I SPRANG FROM THE BENCH TO SEE WHAT WAS THE MATTER.
AWAY TO THE WINDOW I FLEW LIKE A HIGH TENSION FLASH,
TORE OPEN THE SHUTTERS AND THREW UP THE SASH.

THE MOON ON THE BREAST OF THE NEW FALLEN SNOW,
GAVE THE GLOW OF TUBES OF DAYS LONG AGO.
WHEN WHAT TO MY WONDERING EYES SHOULD APPEAR,
BUT A MINIATURE SLEIGH, WITH MOBILE AMATEUR GEAR;

WITH A LITTLE OLD HAM, SO LIVELY AND QUICK,
I KNEW IN A MOMENT, IT MUST BE ST. NICK.
MORE RAPID THAN McELROY, HIS KEYING IT CAME
AND HE LISTENED AND HE TUNED AND CALLED THEM BY NAME;

"NOW DASHER! NOW DAMPER! NOW PHASOR AND DX'EN,
ON COMMON! ON COUPLED! ON DONOR AND BLITZEN!
TO THE TOP OF THE SHACK, TO THE TOP OF THE WALL!
NOW DASH AWAY! DASH AWAY! DASH AWAY ALL!"

AS DRY DAYS BEFORE THE FIELD DAY DO FLY,
WHEN THEY MEET WITH THE FORECAST AND NEVER COMPLY,
SO UP ON THE SHACK TOP THE SIGNALS THEY FLEW,
WITH THE SLEIGH FULL OF GEAR, AND ST. NICHOLAS TOO.

AND THEN IN A BAND OPENING I HEARD ON THE ROOF,
ANTENNA WORK BY A HAM ON THE HOOF,
AS I DREW IN MY HEAD AND WAS TUNING AROUND,
DOWN THE FEEDLINE CAME ST. NICHOLAS WITH A BOUND.

HE WAS ALL TANGLED IN COAX, FROM HIS HEAD TO HIS FOOT
AND HIS CHECKSHEETS WERE ALL TARNISHED WITH ASHES AND SOOT.
A BUNDLE OF GEAR HE HAD FLUNG ON HIS BACK,

AND HE LOOKED LIKE A CONTESTER OPENING A SIX PACK.

HIS HANDHELD-HOW IT CRACKLED! THE SIGNALS WOULD VARY!
HIS EQUIPMENT MADE NOISES, HIS QSO WAS QUITE MERRY!
HIS DROLL LITTLE MOUTH WAS DRAWN UP LIKE A MHO
AND THE BEARD OF HIS CHIN WAS WHITE AS SLOW SCAN SNOW.

THE STUMP OF A PIPE HE HELD TIGHT IN HIS TEETH,
AND THE SMOKE IT ENCIRCLED HIS HEAD LIKE A WREATH.
HE HAD A BROAD FACE AND A ROUND LITTLE BELLY,
THAT SHOOK WHEN HE LAUGHED, LIKE THE ROLL OF A TELE.

HE WAS CHUBBY AND PLUMP, A RIGHT OLD ELF,
AND I LAUGHED WHEN I SAW HIM, IN SPITE OF MYSELF;
A WINK OF HIS EYE AND A TWIST OF HIS HEAD
SOON GAVE ME TO KNOW I HAD NOT TO QR-ZED.

HE SPOKE NOT A WORD, BUT WENT STRAIGHT TO HIS WORK,
AND TUNED ALL THE FINALS, THEN TURNED WITH A JERK,
AND KEYING HIS FINGER ASIDE OF HIS NOSE
AND GIVING A NOD, UP THE FEEDLINE HE ROSE.

HE SPRANG TO HIS SLEIGH, HIS HANDHELD GAVE A WHISTLE,
AND AWAY THEY ALL FLEW, LIKE THE DOWN OF A THISTLE.
BUT I HEARD HIM EXCLAIM ERE HE FADED OUT OF SIGHT;

"HAPPY CHRISTMAS TO ALL

AND TO ALL

A GOOD NIGHT"

K1YPP

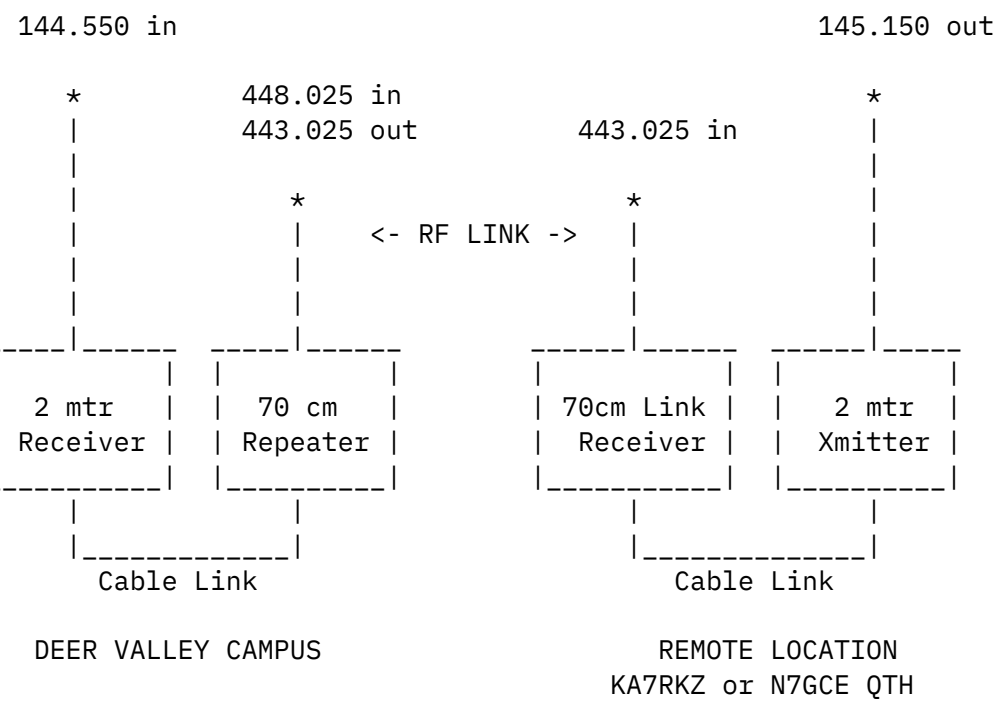
AMATEUR RADIO NEWS FOR THE MONTH OF DECEMBER, 1984

REPEATER UPDATE

John, KF7B, has contacted the Arizona Repeaters Owners Ass. and has good news. The 144 to 145 Mhz FM Repeater sub bands are available for "Back Porch" type repeaters. A Back Porch repeater is one which runs a 100 watts or less and has an maximum antenna height of 100 feet. This is perfect for our application. The two meter frequency pair that has been approved for our club is: 144.550 Mhz in and 145.150 Mhz out. Bud, W5BDZ, has all the hardware to get the two repeater going, the only thing needed is to order the crystals. We have been talking about running the two meter repeater as a split site system, placing the receiver at the Deer Valley campus and the transmitter at someones home QTH. This will eliminate the need of a duplexer. We would link the repeater together via the 443 Mhz repeater. We are in need for both finical and time support to make it happen. There are three xtals to buy and several hours of debugging. Tom, WB7ASR, has the two meter receive xtal on order. If you want help with this project, contact John, KF7B, at x4008, in Deer Valley. The target date to have the two meter repeater up and on the air is mid-January.

PROPOSED TWO METER REPEATER CONFIGURATION



A XMAS PRESENT TO THE WORLD FROM A GERMAN AMATEUR RADIO CLUB

Since the ionosphere is at a low density level due to the eleven year sum spot cycle, a German Amateur Radio Club will launch four barium capsuls into the ionosphere that will cause the ionosphere to become extremity dense. The metallic powder will be launched from a air-craft on December 25th, at 1208 UTC (0508 MST) to a elevation of 60,000 nautical miles. Radio conditions

from 30 Mhz and up should be considerly improved for about four to six hours. Also take note, with the metallic powder in the sky, the sun rise should be one not to miss.

VU2RG IS INDIA'S NEW LEADER

Rajiv Gandhi, VU2RG, son of India's slain leader Indira Gandhi, is prime minister of the worlds largest democracy. Chosen by his party and sworn in to office only hours after his mother's death on October 31, Rajiv will head the country until at least January, when national elections must be held. A former pilot with Air India, he entered the political arena in 1981, when he became a member of Parliament. His political future was all but sealed when his mother named him a general secretary of the ruling Congress Party.

HAMS IN SPACE

The latest word on the proposed April 1985 Amateur Radio operation from abord the Space Shuttle is that Astronaut Anthony England, W0ORE, will not be the only ham aboard. Dr. John-David Bartoe, W4NYZ, of the Naval Research Laboratory will be accompaning him. Dr. Bartoe will be a payload specialist for the CHALLENGER STS-51F mission. Groundwork for the project is proceeding on the assumption that formal notification of acceptance from NASA is forthcoming.

ALso, Dr. Ron Parise, WA4SIR, is schedled to fly on STS-61F, as a Payload Specialist. Dr. Parise is an astronomer with a Phd from the University of Florida (1979) and is 33 years old. He has been a licensed amateur since he was 11 having held prior calls WN8JBR and WA8MHD. Ron is a native of Ohio, is married and has a young son. Regarding his operating Amateur Radio from the shuttle, Ron says he is "ENTHUSIASTIC" and looks forward "to bring some radios aboard." Ron says he will support proposals to NASA for Amateur Radio activity on the mission he will be flying.

AMSAT-OSCAR 10 HAS NEW OPERATING SCHEDULE

This new schedule is effective immediately, and should not require any modifications until mid-January. Remember that OSCAR-10's orbit of 699.5 minutes is measured in 256 divisions, with zero starting at perigee. This measurement is called Mean Anomaly.

MEAN ANOMALY	MODE	TIME
0-99	B	Mon-Sat.
100-117	L	Mon-Sat.
100-117	B	Sun.
118-218	B	Daily
219-234	OFF	Daily
235-256	B	Daily

  35   N  673 ALL    K7PYK  841115 HF SCHEDULE
UNTIL FURTHER NOTICE THE HF STATION WILL BE ON 20 METERS FROM 1700Z TO
2400Z MONDAY THROUGH FRIDAY AND FROM 0500Z TO 2400Z ON WEEKENDS AND
HOLIDAYS. THE FREQUENCY IS 14.103 LSB USING AFSK AND 1600 HZ. AND 1800
HZ. TONES (IN OTHER WORDS 14.103 LSB WITH A TAPR TNC). HE REST OF THE
TIME IT WILL BE ON 30 METERS. THAT FREQUENCY IS 10.1496 LSB (TAPR TNC).
AT PRESENT THE VHF STATION WILL BE ON 144.91 MHZ. AS SOON AS SOMEONE IN
TUCSON GETS A GOOD SIGNAL INTO THE 10/70 REPEATER I WILL TUNE THE VHF
STATION TO THAT REPEATER. ESTIMATES RANGE FROM A WEEK TO SEVERAL WEEKS
DEPENDING...  IT'S ENCOURAGING TO SEE SO MUCH ACTIVITY. THANKS FOR THE
SUGGESTIONS.
73 FOR NOW...SIGNED  WES

SO FAR I HAVN'T DONE MUCH WITH A GATEWAY FOR AO-10
IT'S DIFFICULT TO GATE IT TO THE LOCAL 2 METER NET BECAUSE OF THE
PROXIMITY OF THE TWO 2 METER STATIONS. MANY OF THE HF STATIONS ALSO HAVE
AO-10 CAPABILITY. COUPLE ALL THAT WITH THE CHANGING SCHEDULE AND SOMETIMES
MARGINAL SIGNALS FROM AO-10 SO I SAY (ON THE SATELLITE BEACON) "MAILBOX/
GATEWAY AVAILABLE ON REQUEST". SO FAR IAN (ZL1AOX) HAS BEEN THE ONLY TAKER.
```

I HEARD YOU ON AO-10 EVERYBODYS SIGNAL WAS TOO WEAK TO COPY HERE.

**********   SOFTWARE COURTESY of HANK W0RLI   **********

The HF system includes a transceiver (IC-720A),a 30 meter beam
(KLM 30M-3) up 42 feet, and a Swan tri-bander up 55 feet.

The VHF system is a 2 meter transceiver (IC-27A) and a Ringo
Ranger up about 20 feet.

The satellite station's uplink is an IC-471, a Mirage D1010,
45 feet of half inch hardline, and a KLM 18-C cross yagi.
The downlink is a KLM 22-C cross yagi, a AR^2 GaAsFET preamp
at the antenna, and an IC-271.

The system uses 3 TAPR TNC's and can link HF stations to either
the satellite or the 2 meter LAN which includes the Phoenix and
Tucson area.
Work is proceeding on the computer interface and software to
enable the 720A to scan the hf bands. Also in the mill is the
system which will tune the satellite station automatically.

Other functions supported are message store and forward, file
upload/download, and information about stations heard or connected.
The computer is a Xerox 820 board with two eight inch disk drives.
The HF port is 300 baud, 200 hz shift, centered at 14.101,3 Mhz.on
20 meters (That's 14.103 Mhz. LSB using a TAPR board) and 10.147,9
Mhz. on 30 meters (That's 10.149,6 Mhz. LSB with a TAPR board).

The hf radio is on 20 meters in the daytime and 30 meters at night.
The VHF port is on 146.10/70 1200 baud, NBFM.
The system is on forever. ...Well almost forever.

Does anyone on the net know about how much a Swan VFO unit should
sell for? I'm looking for one, but I'm always too late. Of the two
that I almost got, they were both in good shape (or so I was told)
but the prices varied greatly. One was less than $50, the other well
over $100. Does anyone know where I might find one? I would like
the one that attached to the Swan 500C, I'm told there were three
different models for the 500. There was a 4xx number VFO that had both
the VOX and the VFO in one box, which would be real nice. I have the
VOX unit now, but it attaches to the back of the unit where it is
very difficult to adjust. I set it for a real slow semi-break-in
on CW. The unit that is in the 500C owners manual is the 508. It is
a VFO unit only. Both units that I was too late for were 508's. I've
looked into building one, which I may have to do, but the Swan 500C
doesn't use a fixed VFO. Each band is different. There is one fixed
mixing frequency in the main unit and the VFO changes bands. Not that
difficult, but there is always the appeal of the factory unit.

M 19698 Larry Kayser (2967) 12/14/84   4:15 PM L:35
KEYS:/NEED INFO/VRTX/SILICON SOFTWARE/
TO: (Group 95)

To #95 EIES, TMAIL AMSAT From Larry Kayser Information needed - Re VRTX and the VRTX C Language Library

VRTX is a Versatile Real-Time Executive for micro systems that has multi tasking and real-time operating system. It has many features amongst them - Interrupt-driven, priority-based scheduling Intertask communication and synchronization Dynamic memory allocation Real-time clock control, with optional time slicing Character I/O support Real-time responsiveness (what ever that means!)

VRTX is a product of Hunter & Ready, 445 Sherman Avenue, P. O. Box 11803, Palo Alto, Ca 94306. (415) 326-2950

Would anyone with direct experience with this product, or with contacts that can be approached about this product get in touch with me ASAP. Anyone with information about this product being placed in a CMOS masked ROM (High Rel - but I am probably dreaming) can probably negotiate a free bottle of scotch or equivalent. This product has a number of interesting features that would make it very attractive for some amateur radio applications.

Please move this request around, to USENET etc to find some contacts.

Regards, Larry Kayser 36 Glebe Ave. Ottawa, Ontario, Canada K1S 2C1 (613) 239-2089 Days or (613) 2343816 Evenings

x

WARC-79 proposed to allocate 18.068 - 18.168 MHz exclusively for Amateur and Amateur Services. But this won't take effect until the fixed stations presently using this band are relocated (no later than 7/1/89).

Several US Government agencies have allocations in our new proposed ham band:

hr arrl bulletin nr 115 from arrl headquarters
newington ct december 12, 1984
to all radio amateurs bt

in a move designed to improve service to the arrl members, and hq efficiency and to more effectively address recruitment/membership promotion goals, a reorganization of the arrl hq structure is being implemented. effective immediately, five offices have been established, with each office manager reporting to the general manager. the five offices are publications, volunteer resources, membership communications services, development, and administrative services. the office of publications coordinates the activities of the production, circulation, advertising and technical departments. of particular interest to arrl field organization volunteers is the new office of volunteer resources, which centralizes support for the leagues important volunteer community, including the field organization, volunteer examiners, affiliated clubs, and league sanctioned conventions and hamfests, into one office. the office of membership communications services is responsible for providing information and individual services to arrl members, such as w1aw, the arrl letter, contests, operating awards including dxcc, legal/regulatory information, and other related activities. the office of development will undertake the substantial recruitment and membership promotion campaign as authorized at the last board meeting, as well as public information and fund raising. the office of administrative services includes accounting, purchasing, central computer, and hq building maintenance. details will follow in the arrl letter and qst ar

qst de k9eui

hr propagation forecast bulletin nr 51 from arrl headquarters
newington ct december 17, 1984
to all radio amateurs bt

thus far in december, the solar flux has been slightly higher
than at the same time in november, but the difference has been
too small to improve propagation substantialy. the highest flux
reading, 81 on december 11, was nearly 14 per cent below the
base figure used in compiling the propagation charts in qst for
december. readings mostly in the nineties or higher would be
needed for good propagation in the higher latitudes of the
northern hemisphere at this time of year.

the flux was at 77 at bulletin time. it should be higher during
the rest of the year, as the area of the sun responsible for
the 86 in late november will be facing the earth again later
this week, having maximum effect december 22 through 26.
erratic conditions prevalent during the past week will improve
gradually. the best signal level and minimal fading will be
observed in the above period. the year will close with the
solar flux falling and geomagnetic activity rising, making for
no better than fair conditions december 27 through january 2.

american sunspot numbers for november 29 through december 5
were between 11 and 19 with a mean of 15.1 ar

Could this knowledgeable group suggest a good short-wave receiver
which would allow me to listen to european stations ?

On the old continent I used listen to different stations (uk, germany,
ussr) on wavelengths from 13m to 51m, mainly because commercial stations

(and also bbc, radio free europe and voa) broadcast in those bands.
But I guess a wider range wouldn't hurt. So, I think I'm looking for
a sensitive and selective receiver for under $200(?). I do not know
in what flavors they come here, but it could be a stand-alone unit
(amp,speaker) or a plain rx pluggable into my stereo system.

The Sony ICF-2002 receivers from their first production run have a
problem with oscillator pulling when receiving strong CW and SSB
signals. I have heard that a circuit modification to fix this problem
has been published.

I have one of these these receivers and would like to fix it! Can
anybody send me the reference, or better yet, a copy of the article
describing the changes?

Summary:

A friend recently gave me an old shortwave radio. I haven't been able
to receive much except Radio Moscow. What I'd like to do is be able to
listen to Israel Radio. Can anyone suggest any books I could read about
shortwave? Does anyone know the frequencies and times of Israel Radio
and or the BBC World Service?

The radio is made by Reader's Digest and all I have is the antenna they
provide. I assume that an External antenna would improve reception.
There is a jack for one. I live in an apartment so an indoor
antenna would be preferable. Can anyone suggest what I should use
for such an antenna?

I am very new to Ham radio and still working on geting my Novice
license togeather (I'm getting pretty close.) My profession is
Electronics Engineering so the theory wont be the problem. I am
looking for information on the various RTTY interfaces to RS-232
computer ports. My main interest is up grading to technition as
soon a possible and get into packet ratio. So if any of you can
provide me with information on which RTTY interface is the best
for the money it would be much apreciated.

Also, the ARRL has just approved the packet switching protocol x.25 addaptation to ham - radio. I also program in assembly and C and would be very interested in developing a program similar to modem7, mex and mdm112 for CPM systems which would utilize this protocol for ham. If anyone can furnish me with information concerning this protocol, or can recommend any source of information for this protocol (I already have ordered the new ARRL book on the subject), or source I will share my results.

Thank you,

George Hageman 303-444-3185 (hm)

I've sent this as mail, but am posting it for general interest and because the long path to the addressee makes me fear it will not get through:

Hi!

I hope you saw my Uniden postings in net.ham-radio; several were long comparative reviews of the features of the Sony models vs. the Uniden. If you hadn't, let me know at the address below, and I'll send you copies (it won't be until after New Year, though, as I'll be on leave and cut off from net mail until I return).

I recall seeing your initial query, but I think I didn't respond, being rather burnt-out from extensive radio-related newsgroup traffic. I can offer a few other comments, though, by now...

One other radio, which, though discontinued, is still advertised and may be still available for around $100, is the Sony ICF-6500W. This is a portable with slide-rule dial and an LCD digital readout. Check your local newstand for copies of Popular Communications magazine and look in the ads. Also, 47th St. Photo was advertising this for around $70 in their latest catalog, so some of the other New York discounters may have it too.

The Sony ICF-2002 is the same radio as the ICF-7600D. The difference is that the 2002 is the US (Sony of America) version, and has a US warranty. Don't expect any warranty service on a 7600D; it is grey-market. However, I bought a 7600D myself, as I don't think much of warranty service on this sort of thing -- I figure that, if it works when you get it, it will work at least as long as the warranty covers. My experience with the 7600D bears this out -- no trouble. The other difference is in the accessories. The New York discounters play games with these. They ask an extra $10 for the AC adapter, whcih they remove from the package and sell separately. The 7600D AC adapter is multi-voltage; the 2002's is 110 VAC only. If you travel overseas, the former would be useful. I bought neither, and made my own from one I had for a defunct calculator.

Other accessories you should look for include an external battery pack. This holds 4 "C" cells and plugs into the external power jack on the 2002/7600D, to use instead of the 4 internal "AA" cells for longer battery life. It doesn't sound too great to me; it impedes the main advantage to the 2002/7600D -- the small size and extreme portability. This did NOT come with my 7600D, and I don't know if it was pulled out by the discounter (47th St.), or if it comes with the 2002 only. You may want a more protective carrying case for this radio than the soft cloth bag it comes with; check out camera cases -- one correspondent in RIB said that a "Lowe Pro Opti-Pouch" fit his 2002. However, I've checked camera stores and the Lowe catalog, and cannot find one that fits it right, in that or any other brand. Some almost fit, but are 1/4" too small in one direction. I bought a cheap lady's zippered small purse at Woolworth's that fit it, though. No foam padding but room for accessories and notepads, etc., with the radio. I would like a padded case with a belt loop, though, that would be conducive to hands-free operation while walking. Haven't found one yet.

One other item, just published in the latest (this week!) Review of International Broadcasting: some ICF-2002's (and probably ICF-7600D's) suffered from a "pulling" malfunction in the SSB mode; a strong station near a weaker (when the radio was tuned to the weaker one) would cause the radio to shift off-frequency toward the strong signal. This only has an effect on you if you wanted to listen to amateur radio or utility traffic, not regular SW broadcasters. There is a factory modification, available as warranty-covered work, for this on 2002's. Recent 2002's have this change built in, of course. I don't know if Sony will even do this for money on the 7600D's. I haven't really noticed this on my 7600D, though, so the concern is academic for me. No data is yet available on

the serial numbers the factory revisions began to be installed at,
so I can't define a serial number range for "old" vs. "current" models
of these radios.

Regards,
Will Martin

From the December issue of Miller Publishing's The Shortwave Guide, which
I happen to have with me here at the office, you lucky person!:

Kol Israel: 0000-0030 GMT 7412, 9440, 9815
         0100-0130 GMT the same
         0200-0230 GMT the same
         0500-0515 GMT 9009, 9440, 9815 kHz
         2000-2030 GMT 7412, 9440, 9815 kHz
         2230-2300 GMT 7410, 9440, 9815 kHz (I wonder if 7410 is a
                                misprint?)
(These are the scheduled English-language transmissions.)
(GMT is Greenwich Mean Time, which is 6 hours ahead of Central Standard.
So 0000 GMT is 1800 or 6 PM CST, 0500 GMT is 2300 or 11 PM CST, etc.)

A note in the October Review of International Broadcasting mentions the
possibility that the 0000 and 0100 broadcasts might also be on 11655 and
15585 kHz, and the 0200 also on 11655 kHz, and the 2230 one might also

be on 12025 kHz and 15585 kHz. (The later RIB has a by-country schedule, but I don't have it with me, drat!)

As for the BBC, there are many different relay stations and lots of frequencies. For general purposes, in the US evening, 6175 kHz is the best. 9510 kHz is also good for later in the evening/night. 21660, 15070, and 15260 are good in the mornings, at different times, as various relays come on and off.

As for sources of info. The best is (in my opinion):

Hi,

I've got a friend who will be getting an IBM PC-AT soon, and he's
interested in getting any software that might be available to
enhance his Ham system. I can't directly access any ARPA stuff,
but I'd like to hear from anyone that might be able to help us out.

Hello,

I am looking for all of the varios and sundrie basic and pascal programs that
have been on the net to Calculate orbital elements, track satellites, et al.

Could someone point me in the right direction (towards the archive?) or send
me whatever copies of these you may have handy? I am trying to put together
a disk full as a public domain object for Macintoshes.

              Thanx much,
              Dave, N2BCA

**** UoSAT Bulletin-104 (Edited) 14th December 1984 ****

UoSAT Spacecraft Control Centre, University of Surrey, England

** GENERAL NEWS **

* UoSAT-OSCAR-11 Stabilisation *

Automatic attitude control manoeuvres, carried out by the on-board computer over last weekend, have successfully restored gravity-gradient stabilisation to the UO-11 spacecraft. The spacecraft was inadvertantly destabilised a month previously during a routine despin manoeuvre causing UO-11 to go into a complex tumbling motion. Several weeks of navigation data analysis, followed by four days of autonomous attitude manouevres by the OBC were necessary to de-tumble the spacecraft and recapture gravity lock. The autonomous manoeuvres could be seen by those monitoring the multiple orbit magnetometer data surveys - the attitude algorithm was initiated after the first orbit displayed. Gravity lock, at present, looks even better than before - we shall try to keep it that way! We are back in business!

* NOAA-9 *

NOAA-9 was launched at 10:42 gmt on 12 December - no additional information available at present.

** UoSAT-Oscar-9 Schedule **

This weeks schedule is as follows:

Friday	-	load Bulletin
Saturday	-	Bulletin/DIGITALKER/1200 bps telemetry
Sunday	-	Bulletin/DIGITALKER/1200 bps telemetry
Monday	-	Bulletin/DIGITALKER/1200 bps telemetry
Tuesday	-	Radiation data - next week CCD data
Wednesday	-	Whole orbit telemetry survey
Thursday	-	Computer check-summed telemetry

The 2 GHz Beacon will be in use this week.

** UoSAT-Oscar-11 Operations **

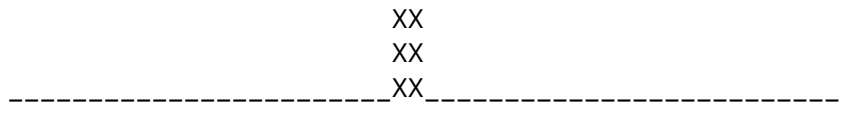
**** UoSAT Bulletin-105 (Edited) 21st December 1984 ****

UoSAT Spacecraft Control Centre, University of Surrey, England

** GENERAL NEWS **



H A P P Y C H R I S T M A S & N E W Y E A R

---

* 1984 *

Thanks for all those who sent Xmas cards, it is nice to know you think of us! 1984 has been a hectic but rewarding year for all at UoS - having overcome the teething problems following the launch of UoSAT-OSCAR-11 in March, we have been most pleased with the spacecraft's performance. The gravity gradient stabilisation has operated extremely well (provided we do not 'kick' it too hard!) and a great deal of work is under way on the various experiments.

The DCE has been in use since May assisting spacecraft operations and is about to be activated as a communications experiment shortly in the new year - although initially in a limited experimental way only.

The Particle/Wave Experiment has carried out experiments in conjunction with the AMPTE spacecraft in November and more are scheduled for April 1985.

Test images have been received from the CCD camera on UO-11, but further work is required on the ground station facilities at UoS before this experiment can be fully evaluated. Considerable efforts are under way on the 9600 bps psk 435 MHz downlink with some success.

Although little has been seen from the Space Dust Experiment, a number of events were recorded in early December - coinciding with a meteor shower. This data is still being analysed.

The OBC has been used continuously to provide autonomous attitude control; whole-orbit experiment and telemetry data surveys; automatic experiment and downlink switching and special experiment support.

The telemetry, telecommand and power systems continue to perform well. The programmable channel 'dwell' facility on the telemetry has been used frequently for attitude control navigational support.

The UoSAT Team would like to thank the very many experimenters world-wide for their support and regular reports on the

spacecraft - they are much appreciated.

UoSAT-OSCAR-9 has had a good year too - supporting a regular experiment schedule and, of course, the Bulletin! The UO-9 schedule is likely to be modified in the New Year to reflect user interests.

The UoSAT Team do, however, suffer increasing manpower problems. Operating two spacecraft - as well as planning future missions - is VERY labour-intensive and there is much we cannot do, due to resource limitations, which we would like to be able to do! We are trying to improve this situation but it will take time.

1985 promises to be a busy year too - more experiments on UO-11 and preparation for PACSAT and other missions - we are looking forward to another exciting year!

* AMPTE Spacecraft Barium Release *

Early risers on Christmas day will be treated to an unusual display from an experiment that will study the Earth's magnetic field and how it affects the solar wind. An AMPTE satellite will release four canisters of barium 70,000 miles above the Pacific Ocean, creating, in effect, a man-made comet. The spectacular display that should result will be visible throughout the western U.S., northern Mexico, southwestern Canada and Hawaii.

At approximately 4:08 AM PST on Christmas morning the West German satellite will eject the canisters and their barium load. The comet will be visible about ten minutes later when sunlight causes the barium atoms to radiate colored light. The display will be visible to the naked eye in an area west of a line running from Chicago to the southern end of Texas. It will not be visible in areas where the sun has already risen.

* NOAA-9 *

NOAA-9 was launched at 10:42 gmt on 12 December - no additional information available at present except that the launch appears to have been successful and signals from NOAA-9 have been received at UoS on 191284.

** UoSAT-Oscar-9 Schedule **

This weeks schedule will be modified as follows due to Xmas:

Friday	211284	-	load Bulletin
Saturday	221284	-	Bulletin/DIGITALKER/1200 bps telemetry until

Wednesday 020184

The 21 MHz Beacon will be in use during this time.

Does anyone on the net know anything about the proposed format for

the networks broadcasting in stereo? The latest info that I got
is that NBC has been sporadically broadcasting stereo of the
Tonight Show since July 26, and that ABC only broadcast selected
cuts of the Olmypics in stereo. I know that PBS is planning on
nationwide stereo before the end of 85.

I just bought a Beta HiFi. It doesn't make sense to me to go buy
a stereo TV receiver. I'm going to run raw video to my TV (after
I gut the tuner, which is shot anyway). Since the Beta will always
be set to channel 3 output, I want to make a separate decoder box
so I can run the stereo signals into the Beta in the simulcast mode
and to the audio amplifier for listening. So far I haven't been
able to find anything out about the format of the encoding. Most
people I've talked to THINK it is either similar to or the same as
FM stereo. If not the same, just a different pilot frequency with
extended frequency response. Does ANYBODY know?

Subject: 220 MHz. Digipeaters in Bay Area

Today I received a call from Scott Miles, WB6PQM, who informed me of plans
to establish two new digipeaters in the Bay Area.

The new simplex machines will be running on 223.58 MHz. and are intended
to serve the needs of RACES in Contra Costa county, linking together all
three parts of the county. The hardware will be based on GLB controllers
purchased and installed by Scott. WB6PQM-1 is currently on the air, and
WB6PQM-2 will be running shortly.

Scott is on the Board of Directors of NARC, and is the 220 MHz. frequency coordinator for that organization.

Scott currently resides at 12 Big Oak Ct., Walnut Creek, CA 94596, and may be reached at (415) 934-6081 (home) or (415) 827-4700 x 49 (work).
His USENET address is UCBVAX!ZEHNTEL!ZPS!DIGGER.

cq de KA6SFV bt

I recently acquired a C64 computer and built the rtty modem described in the SEP-82 issue of 73. With my own brand of receive program the diddles on the air became characters on my screen. It was like learning morse for the first time. What a thrill to finally make sense out of what was previously thought of as 'interference'. I got so hooked on rtty that I could hardly pull myself away from the shack. In fact I worked so late getting the system working, that I couldn't find any rtty stations to receive when I'd make a change in the program. Very frustrating! Now you know the beginnings of my rtty career. Now I'm working on the transmit part of the program.

Now to the questions:

1. What I'd like to know is what rtty modulation techniques are being used, what are the 'usual' freqs and where on the bands that type of operation can be found.
2. Any tips for a neophyte rtty operator?
3. What rtty stuff is happening in the SF bay area.

**** UoSAT Bulletin-100 (Edited) 8th November 1984 ****

UoSAT Spacecraft Control Centre, University of Surrey

** GENERAL NEWS **

** 100th UoSAT Bulletin **

It seems a long time ago now that we generated and loaded the first UoSAT Bulletin back in October 1981 and, since then, the Bulletin has settled down to a regular format after a number of modifications suggested by the 'readers'. The technical feats in loading the Bulletin on a regular basis in the early days have long since been stream-lined - but the editorial effort is still demanding! Material for the Bulletin is gleaned from many sources - Telemail, ASR, various space news sources, G3YJO's thoughts and, of course, the many letters we receive daily from UoSAT experimenters. The response to the Questionnaire transmitted during the summer of 1984 was excellent and provided the UoSAT Team with valuable feedback concerning the most popular and useful experiments and schedules as well as Bulletin content & format suggestions.

The Bulletin was compiled by G3YJO for the first 9 months, then by G8NEF for the following year, before reverting to G3YJO in August 1984 as G8NEF took up full-time teaching commitments.

You may have wondered (or probably not!) how the Bulletin is compiled & loaded. Work commences in earnest early on Friday morning scanning the various news sources and compiling them into the Bulletin file on the UoS Prime mainframe computer. The operations of UO-9 and UO-11 are summarised from the Command Operator's Log and the schedule for the coming week agreed. A list of correspondents/reports for the week is compiled. The Keplerian Elelments are copied automatically from a Telemail file generated by KA9Q in the USA and the 'old-fashioned' EQX's generated automatically by an program and inserted into the Bulletin file. The raw text is then run through a text processor to format it into the 64 character lines compatible with most displays. The processed Bulletin is then run through an 1802 Assembler written by G8NEF which produces a OBC compatible file (with error checking) ready for transmission to the spacecraft, which is executed using bi-directional packet communications with the UO-9 OBC.

The loading of the Bulletin obviously takes longer than the time taken for you to receive it - exactly how much longer depends on the UoS-to-UO-9 link quality - but a few iterations between the OBC on UO-9 and the UoS groundstation Prime are usaully sufficient. Then it is all yours for the weekend!

* UoSAT-OSCAR-11 QSL *

The second printing of these QSL cards was rejected too, but relacements are promised for next week! Patience will be rewarded!

** UoSAT-Oscar-9 Schedule **

This weeks schedule will be modified as G3YJO & G8NOB will be attending the AMSAT AGM in the USA:

Thursday 8th - load Bulletin
Friday 9th to Tuesday 20th - Bulletin/DIGITALKER/1200 bps telemetry
Then back to normal!

The 21 MHz Beacon will be in use this week.

** UoSAT-Oscar-11 Operations **

A daily account of UO-11 operations follows:

While I haven't worked out all of the details, I can see one reasonably
practical method for fairly "secure" communications (for login
sessions with a central computer) via ham packet radio.

This technique assumes either a specialized hardware device, or
a programmable terminal (e.g. Radio Shack Model 100 or some such)
on the remote end. The technique would involve synchronizing a long
pseudo-random sequence on both the mainframe and remote ends, and then
including the "next" element of the sequence as "non-information"
data in each packet sent to the mainframe. This sequence might be
as small as one word or byte of sequence info per packet, and would be
inserted by the remote terminal device--it would not require modifications
to the packet radio boards. While maintaining synchronization would
not be trivial, it should not be terribly difficult.

Additional security might be provided over login sequences, including
specialized pseudo-random query/response sequences to replace
conventional logins via the packet radio channel.

This sort of technique would provide a high level of integrity and
control over sessions, yet would not require the (presumably illegal)
use of encryption over full sessions. It would have the ability
of providing sessions which would ONLY respond to packets from
the designated user and would ignore all other transmissions.

I welcome comments on this technique.

I have noticed that the Russian RS satellites have been somewhat

erratic in operation the past few weeks. In many passes, the beacons are not heard. Further, I have not heard RS-6 in some time, although i have been told that it is no longer functional. Anyone know whats up here? Are the batteries weakening, and they are being used sparingly to extend the satellites life? HELP!

I am in desperate need to find repair parts for a Wilson MR 1000 antenna rotor. I understand Wilson has moved on to new and better??? things and is now out ofd the Ham business. There must be parts stored somewhere for these expensive rotors so I am trying by requesting if there are any hams in the Vegas area who might know someone who works at Wilson?? If there are any parts available there locally. I need a couple of the drive gears and possibly a new ring gear.

Any Help is Appreciated

i too have been thinking about how to verify that a user of
a packet network is who he or she claims to be. i see from
laurens comments that our ideas are very similiar. mine
are still somewhat half-baked but i will present them here
so that others can recommend improvements or alternatives.

what i am considering is the situation that a user would
like to change some parameters of a remote station (digipeater,
host, weather stn, nuclear reactor, etc.) but doesn't want the bad
guys to screw it up. the though would be that when i was connected
to, say, my remote home station and wanted to turn on the the coffee pot,
the home station would respond with a command prompt that included
a random number (64 bits printed as a 16 digit hex value). I would
encrypt that random number using DEA (that's Data Encryption Algorithm,
the software approach to DES) using the key-of-the-day and return
it with my command to turn on the coffee pot. my home station would
also encrypt the random number it generated using the same key and
compare the result with what i sent to it. if they are the same
then it is very likely i am who i say i am (within the 'bad-guys'
fudge factor) and the home station will switch on the coffee pot.
if they don't match, the home station will give me a new prompt
and a new random number to encrypt and send back with my command.
note that the command and response are not encrypted, only the
verification data.

because every prompt from the home station would include a NEW
random number and because the keys are changed daily, it would
be very difficult for a 'bad-guy' to masquerade as a 'good-guy'.
Simply repeating the command and the encrypted random number
wouldn't solve the problem for the 'bad-guy'. more sophistocated
techniques would be needed (and i am sure the 'bad-guys' would
try them -- some might succeed).

If you don't like DES/DEA then choose another encryption scheme.

At the least, DES is a known algorithm that offers good security.

what do others think about this???

WWV broadcasts Geoalerts at 18 minutes past the hour. I am interested
in how to apply this information to obtain propogation conditions.
Either references to published works, or a computer program
would be useful.

I will summarize to the net.

I'm considering putting up a small triband beam but don't want
to buy a tower. I would also like to avoid holes in my roof and walls.
I would like to mount it on my chimney, but don't know if this
is a good idea given the weight and windload (although the chimney
IS fairly sturdy). Any ideas, suggestions, hints? Is there a
GOOD chimney mount kit available? The antenna would end up at about
the 30 foot level. Is this too low for decent 20 meter performance?
Any opinions as to the "best" small tribander (Moseley, Cushcraft,
Hustler, Hy-gain) ? Would a quad be a better choice?

Yes, the present price for the Cushcraft R3, in my opinion, is a bit steep, but it works. I purchased an R3 at Dayton in spring of '83, $215 including shipping from Edge, Inc.

I did not install the antenna until Oct 1983. For background information, Cushcraft announced the antenna in 1980. The R3 was reviewed in the April '83 issue of CQ, pages 40 through 43. The R3 is essentially an end fed 10, 15, & 20 meter trap half-wave vertical. The matching network at the feed end consists of a tapped inductor (the ring) in parallel with an air spaced variable capacitor driven by a small motor. In my unit the drive motor is a 1 RPM Airpax (K81352-P3-S2). The motor also drives a 1000 ohm pot for the simple control box readout. The capacitor has 13 rotor plates and 14 stators, with a rotor to stator spacing of .070". This is not the original capacitor pictured in some of the early advertisement literature. The number on my capacitor is 73175 27DEBB.

The antenna has a slim wind profile, and I mounted the R3 on my chimney with an all stainless steel South River Model 2002 Chimney Mount (about $20). My XYL thinks it looks fine.

Ok now the shortcomings. After about one month, and a few rain storms the tuning became erratic. I took the antenna down and found water between the rotor and stator plates. I think the water wicked down the threads of the ceramic feed-through screw, then down the aluminum strap connecting the feed-through and the tuning capacitor. The the water settled between the capacitor plates. The feed-through, the cracks and seams in the plastic cover, the screw holes and the threads should be sealed with RTV, I used Dow 3145 RTV Adhesive/Sealant. A more severe design problem, in my opinion, is the use of aluminum capacitor plates and threaded brass tie rods and nuts. In one month their was evidence of corrosion or galvanic action between the brass and aluminum. I replaced the aluminum strap connecting the feed-through

and capacitor with a homemade strap made of brass. I also replaced the nickel plated feed-through screw with a brass screw and used brass nuts on the feed-through. I covered the outside connection of the feed-through with a good covering of RTV. The one end of the aluminum inductor ring attaches to the feed-through. Also replace or RTV the screws on the control cable terminal strip, they are steel.

Since Nov. '83 the antenna has performed quite well, I have worked my share of DX during contests. The antenna presents a clean appearance and DOES NOT REQUIRE RADIALS. I have been thinking about making a ground mounted 40 meter version.

One other comment, I have an all electric home with a fire place in the basement. I have not been using the fireplace for a few years. If you should chimney mount a unit on an in-use chimney you might have to mount the R3 higher to avoid the hot gases.

Best of luck and 73.....Rich Ahrens, W3WJC

qst de k9eui
hr propagation forecast bulletin nr 47 from arrl headquarters
newington ct november 18, 1984
to all radio amateurs bt

the solar flux has been between 69 and 77 since early september. the most recent comparable low came in may, june and the first few days of july 1976. that ten week summer period had much less impact on thu dx scene than the present low which began just as the northern hemisphere was moving into its best month of the year for worldwide dx on the higher frequencies. as for sunspots, the author of these bulletins has never seen the surface of the sun so clean, or for so long, in more than ten years of observation, including the final two years of the previous solar cycle.

propagation was fair to poor on all frequencies much of the past week as predicted. during a major geomagnetic storm on the 16th, the geomagnetic a index reached 76, its highest in more than two years. this produced watery and weak signals on all hf bands and a wild aurora delighted the vhf fraternity in the more northerly states. aftereffects of this disturbance may be with us for a day or two, however, much better propagation will move in after about the twenty first. the solar flux is unlikely to go above the middle seventies, so dx opportunities on 21 and 28 mhz will be brief, except for low latitude east west and low latitude north south circuits.

american sunspot numbers for november 8 through 15 were between 3 and 19 with a mean of 13.6 ar

WHAT IS BAUD RATE ?

Baud rate is the basic rate of information exchange. It refers to the number of changes a signal makes in one second.

The signal changes to off or zero at one second, back to a one at two seconds, and back to zero at three seconds, and so on. So, after one second it has changed once, after two seconds it has changed twice. Hence, it changes one each second and the baud rate is therefore ONE.

For most RTTY found in the amateur bands, the baud rate is 45.45. This means that each bit of information within each RTTY character is 1/45.45 seconds in duration. Another way to say it is that a 45.45 baud, the signal changes 45 times in one second. For all the speeds of RTTY, the following table applies.

BAUDOT SIGNALING RATES AND SPEEDS

Signaling Rate (bauds)	Data Pulse (ms)	Stop Pulse (ms)	Speeds (wpm)	Common Name
45.45	22.0	22.0	65.00	Western Union;
	22.0	31.0	61.33	60 Speed
	22.0	33.0	60.61	45 bauds
50.00	20.00	30.0	66.67	European; 50 bauds
56.92	17.57	25.00	76.68	75 speed
	17.57	26.36	75.89	57 bauds
74.20	13.47	19.18	100.00	100 speeds
	13.47	20.21	98.98	74 bauds
100.00	10.00	15.00	133.33	100 bauds

NEW 24-Ghz RECORD

A new 24-Ghz record apparently was set on August 11th, when I0SNY/IC8 and I8YZO/8 established a two-way CW contact spanning 331 km. I8YZO/8 operated from Mt. Montalto (in the Aspromonte Mts.), in southern Italy, at an altitude of 1956 meters. I0SNY/IC8, operated from Mt. Epomeo, on the island of Ischia (off the coast of Naples), was at an altitude of 788 meters.

It'll Never Work 30 DB of GAIN ?

Would it be possible to have an HF antenna with 30db of gain on 20 meters? What you say, Crazy!!!!

But think, A flashlight has at least 30db of gain. The light shines in all directions, but the reflector concentrates the light beam down to a fine cone. If we could build a reflector large enough for 20 meters, we could do it!

Now, how big would this dish have to be? Let's assume that it would have to be at least ten wave lengths wide in order to simulate the action of a flashlight reflector. Let's see, ten times 20 meters would be ten times about 3.3 feet or 300 feet. Once. I guess it depends on how bad one wants to simulate a flashlight.

An acre of land is about 220 by 220 feet. Our dish would then be about the size of one acre! Oh, how high up would we want this rig? Would the dish work on it's side? Probably not. We would have to elevate it at least a wave length or so. I think this idea has gotten out of hand. Maybe a computer would work better, using it to control a dozen verticals. Phase all the verticals together under program control, thats it. Hm?

TRN TO GIVE PACKET RADIO OVERVIEW

"PACKETEERS" and other interested in knowing more about this exciting new

mode for Amateur communications should tune in to the North American Teleconference Radio Net on December 2nd, at 2400Z. Two leading authorities in packet radio technology, Lyle Johnson, WA7GXD, and Harold Price, NK6K, will give a presentation entitled "Packet Radio Overview and Perspective." Access to TRN is provided by more than 180 gateway stations, mostly VHF repeaters, linked to cover virtually every metropolitan area in the U.S. and much of Canada. In the Phoenix area, tune to 147.240/147.840 Mhz repeater.

Sponsor for the TRN is the Midway ARC, of Kearney, Nebraska, under the direction of club President Merlin Feikert, WB0USW, and Net Manager Timothy Loewenstien, WA0IVW. In the Phoenix area, the Motorola ARC is the sponsor along with the ARA (Arizona Repeater Association).

NEW FORM 610

Planning to upgrade? Renew? Change your address? Apply for a Novice exam? If so, you'll be facing a new FCC form 610. Although Volunteer Examiners will have a big hand in filling out the recently revised form, the applicant's portions have not changed significantly. The new forms are available for a business size S.A.S.E. from FCC in Gettysburg and all FCC field bureaus.

DECEMBER IS THE MONTH FOR BIG CONTESTS

ARRL 160 meter CW Contest, from 2200 UTC November 30 to 1600 UTC December 2nd.

ARRL 10 meter, all mode Contest, from 0000 UTC December 8th to 2400 UTC December 9th.

ABUSE IT AND LOSE IT

Part # 97.114 of the FCC Rules and Regulations

The transmission or delivery of the following amateur radiocommunications is prohibited:

(a) International third party traffic except with countries which have assented thereto:

(b) Third party traffic involving material compensation either tangible or intangible, direct or indirect, to a third party, a station licensee, a control operator, or any other person:

(c) Except for an emergency communication as defined in this part, third party traffic consisting of business communications on behalf of any party. For the purpose of this section, business communication shall mean any transmission ot communication the purpose of which is facilitate the regular business or commercial affairs of any party.

NEW THIRD-PARTY AGREEMENT

The United States has signed a third-party traffic agreement with St. Christopher, Nevis and Anguilla. St. Christopher is known as St. Kitts. Call sign prefixes are VP2E and VP2K. This agreement went into effect 08 August 1984.

MYSTERY SATELLITE

A "MYSTERY SATELLITE" has been heard on several occasions. Paul Wilson, W4HHK, of Collierville, Tenn., says that he has heard satellite signals on 2301.0 Mhz. During the two-hour period, on October 5th, Wilson heard a steady carrier with doppler shift on 2304.0 Mhz. At 0212 UTC, the dish heading was 52 degrees azimuth, 20.5 degrees elevation. The signals and headings were confirmed with WA4HGN, 80 miles away. W4HHK uses a 18 foot dish and WA4HGN a 28 footer. Signals were 20 to 30 db out of the noise.

The signals were heard again at 1754 UTC the same day, in the same general heading. If anyone is interested in these mysterious satellite signals, contact Wilson at box 73, Collierville, Tn. 38071, Tel: (901) 853-7373.

160 METER NEWS

The FCC has proposed to reallocate half of the 160 meter band (1900-2000 Khz) to non-government radio location because of the anticipated expansion of the AM Broadcast Band. This would force certain radiolocation stations to move. Although the September 11th release of Docket 84-874 came as a surprise to the Amateur Radio community, ARRL took a swift reaction.

ARRL filed a motion to hold this NPRM in abeyance pending the resolution of an ARRL petition filed September 10th.

Ironically, the day before this NPRM was released, the ARRL filed a Petition for Initiation of Inquiry Procedure on the present use of the medium Frequency bands by non-government radiolocation users.

The purpose of this inquiry is twofold:

First, to define the spectrum requirements of individual users, and second, to find the number of radiolocation stations needed in a given geographical area. The ARRL requests that the Commission take a look at the spectrum efficiency and the technical need for the use of the 1900-2000 Khz band by non-government radiolocation users. As we go to press, we have no indication of the course that the FCC will follow in this case, which is beginning to look like the bureaucratic equivalent of a soap opera. For further info on this matter, watch the RTTY bulletins from the ARRL.

BETTER WORD

To refer to children as harmonics may be cute but it doesn't fit the facts of life, electronic or human. Figure ir out. A harmonic is an integral multiple of a signal fundamental frequency. A ham harmonic, it follows, would have to be the offspring of a single parent. Parthenogenesis (look it up in your dictionary) occurs in plants but not in people. A better term would be heterodyne, which is a third signal that results from the mixing of two different frequencies. If you think your kids are especially bright, you can call them superheterodynes.

Actually, there is no regulation that prohibits me from using Citizen's Band the course of my business. On the whole a fairly accurate article.

-Ron

(If manual intervention will be possible to prevent this from getting
sent out the ARPA gateway, please do so. If you are reading this on
ARPA or MILNET, please forgive the duplication.)

The new BRL-based gateway for net.ham-radio to Info-Hams is working;
I'm not sure of the reverse feed. The following is an item I posted on
the ARPA side a few days ago, before the gateway was up and running (as
far as I was aware), but failed to post on the USENET side at that time.
Sorry about that.

Hi! Just got back from a trip and being sick, and find lots of interest
in the Uniden, according to my mailbox... Here's another place that
is at least advertising the CR-2021's in their catalog. You'll have to
call to see if they really have any in stock, though.

Scanner World, USA
10 New Scotland Ave
Albany, NY 12208
(518) 436-9606

Price is $94.99, plus $4.00 shipping, total $98.99.

By the way, ask for their catalog if you call, even if they are out of
the radio. They have more info on the Uniden in their catalog than any
other ads I've seen, including Uniden's own flyer. Someone asked about the
IF bandwidth specs, and this lists them: Wide = +-3 kHz at 6 db, +-6 kHz
at 50 db; Narrow = +-2.5 kHz at 6 db, +-5 kHz at 50 db.
(Don't sound so good in print, do they? Nonetheless, the narrow position
cleans up the interference fairly well, such as on the BBC on 6175, which
has WRNO on 6185 and Radio Nederland on 6165 on either side.)

Their catalog has a lot of scanner specs in it, so it's a handy reference
when comparison shopping.

Good luck!

Will

Actually, I believe that the FCC no longer issues CB licenses; they have
"deregulated" CB radio. You simply purchase one and talk.

qst de k9eui
hr propagation forecast bulletin nr 48 from arrl headquarters
newington ct november 26, 1984
to all radio amateurs bt

after ten weeks at close to quiet sun levels, the solar flux started upward november 17. from 72 it rose to 85 by the 25th, and may continue upward another day or two. this rise came as geomagnetic activity was declining, making for some of the best propagation 0f the autumn dx season. improvement was most marked on 21 mhz. on 28 mhz, there was some propagation to africa from eastern usa, and north south conditions were good.

geomagnetic activity will be rising after about the 27th, and propagation will be more variable through about december tenth. the major geomagnetic disturbance of mid november will recur, probably at lower levels about december 13 to 15.

it is too early to tell if the new solar activity in recent days is more than a brief event. it could signal a critical period in which predictions based on the rotational period of the sun become unreliable. more on this later in subsequent

bulletins.

the updated table of ten meter beacon stations announced in bulletin number 46 is still available. send an sase to ed tilton, w1hdq, po box 137, canton, ct 06019 ar

A while ago there was a spate of articles on the Uniden CR 2021 radio.
Fantastic value at $89 or so. Well now it seems they are no longer
{ri Radio Center and tried to buy another yesterday. They told me they
were sold out and would not be getting any more. So I tried National
Tower - same story only they also told me they had bought a one time lot
of 3000 and they were now discontinued.

Speculation - since Uniden also makes the virtually identical DX400 which
sells for $300 in Radio Shack did they sign a deal which prohibits them
from importing any more 2021s into the US?.

Help ! does anyone know where 2021s are still available. I want to get
one for my daughter for Christmas.

Thanks in advance if you can help

Mike Gingell

>"Let's see, ten times 20 meters would be ten times about 3.3 feet or 300
> feet."

Given that a meter is about 3.3 feet, then 20 meters is 66 feet. Ten times
that would be 660 feet. This would be 9 square acres, not one acre!

   > listening to the 800mhz. frequencies?

800 MHz converter:

     Hamtronics, Inc.
     65 Moul Road
     Hilton, NY 14468-9535
     tel: (716)392-9430

800 MHz scanner:

     None available at this time.

Watch for the Regency MX7000 (really an MX5000 with
a built in converter) in January 1985.

I have a Heathkit HW101 for sale with power supply in
great condition. I am so sure of it's condition that
I will give a 30 day warranty to the buyer.

I am asking $300 but is negotiable if the warranty is
waivered. Some spare tubes (new no finals but they are
less than 1 yr old) and mike connectors are included.

Make me an offer I can't refuse! It would make an
excellent Christmas gift.

I believe that commercial use of the CB channels is limited to certain
channels. It may be off the book, but back in the 60's CB channels
were dedicated for specific uses. Certain channels could be used for

talking between different licenses, other channels were for talking
between unit of the same license, i.e. for a mobile to call HIS base rig,
and other channels were for commercial use. In practice, noone cares
about anyrule on the CB, but I don't know if the restrictions are still
on the books.

Also, Childrens Band (sorry, C.B.) was intended to be a "Business"
radio system at it's creation. Units could only talk to other
units under the same license, except for a few circumstances such
as asking directions, emergencies, /etc. Now CB licenses aren't
issued (or required) any longer, and a sizable number of CB'ers are
running considerably more than 5 watts, illegally of course.
Most Police cars with CB's listen to channel 19 (or the local
"highway" channel) to find out when their hiding places are
given away by "Bear" reports when running stationary radar.
Most other times they are off or squelched tight enough that
they don't have to listen to the constant garbage on the
channel.

I need information on how to recover a 12 Volt rechargeable power pack
that will only charge to 10 Volts. I believe it is a 'Gel' cell which
I understand to be a lead acid battery encased in a gel. Does this
2 Volt drop indicate a shorted cell? Is it possible to blast this
short by using a high voltage, high current supply? If so, how high and
for how long? It is a 48 Watt Hour battery.

Thanks in advance for your help.

I've seen several notices in this newsgroup, and also seen and heard
references in other ham publications and radio programs, referring to
the use and authorization of "commemorative" or "special-event" callsigns.
It seems that these are usually just a replacement of the normal prefix
of a callsign with some other prefix, and effective for a limited time.

My query is, basically, "why?" -- I understand a special callsign for
a special-purpose station, like one at a World's Fair, with a call
like "W85WF" or something for the "1985 World's Fair". But how does
letting hams use an extra letter "F" or something in their calls "honor"
or "commemorate" the sequicentennial of the invention of the combine,
or the state visit of the Maharajah of Ummagumma? Usually the special
prefix doesn't seem to be a mnemonic related to the event or occasion,
even.

Do those of you who are active hams ever use the special calls? I would think
that you are proud of your call as is, you have devised clever acronyms
or phonetic spellings related to it, and you have no real interest in
using a different one for a week or month. Am I right in this?

Are these things really worthwhile or just gimmicks?

Will Martin

Scanner World in Albany NY still has a few left. Cost is $94 plus $4
shipping. Their telephone number is (518)-436-9606. As far as I
know, they are the only dealer that has not sold out. Hope you can
still get one.

Does anyone know if Amateur Radio call books are available on microfiche ?

<gulp,gulp,gulp, CHOMP>
I won't bore the readers of net.ham-radio with a repeat of what amateur (ham) radio is -- it would take too long to cover all the facets of this wide-ranging intersting national resource, which is also a fascinating hobby -- besides many of us are hams already. However, I'll be glad to discuss ham radio with anyone (including the licensing requirements) via email (address is {ihnp4|or your favorite gateway machine}!lcuxc!wjm).
I also won't repeat my general comments about CB ("Children's Band") since I don't use that kind of language either on the air (which is illegal) or on the Usenet.
Personally, I think the idea of CB was reasonable - provide the general public with a group of radio frequencies they could use for such things as calling for help when they break down on a deserted road, talking to other travellers to break the monotony of long trips -- certainly a boon for truckers, and telling ones boss/spouse that one will be late due to traffic jams. It also is useful for very small businesses (like one or two car taxi companies) who cannot afford and don't need the higher power and more elaborate equipment of land mobile VHF business band radio and for radio control hobbists.
The vast majority of law-abiding CB'ers who operate within the FCC rules for CB prove this point. Also, no discussion of CB would be complete without mention of REACT, an organization which uses CB for public service and emergency communications purposes. I'd like to take this opportunity to commend the REACT teams for a job well done, as well as invite them to join the ranks of the many hams who use the greater capabilities of ham radio for these purposes.
However, I think the implementation stinks. CB should have been put in a region

where skip is very rare, such as an unused UHF television channel (perhaps take over channel 70, just below the celluar mobile phone frequencies?) Admittedly, UHF equipment costs more than the 27Mhz gear, but the potential for much of the abuse is eliminated - it is less likely that illegally modified gear will even work, much less splatter QRM into TV's and audio gear (something we hams often get a bum rap for - and I sometimes get a CB'er in my stereo system to boot (usually due to front end overload as they're driving down the street)!).
However, 27 MHz CB exists, so what can we do about it?
Probably the two greatest abuses are 1) the characters who operate over power with illegally modified ham linear amplifiers and 2) the sewer-mouths who put all kinds of "air pollution" (4 letter words) on 27MHz, use Channel 9 for chit-chat, and generally sneer at the rules.
The cure for #2 is what we use on the ham bands - self policing. Law abiding CB'ers should set up somthing like the ARRL's OO teams (perhaps REACT could do this) and report violaters to the FCC. Peer pressure could be useful here, if no one talked to these clowns, they'd probably clean up their act.
My suggestion for #1 is that dealers refuse to sell radio equipment to anyone UNLESS the purchaser shows a valid license for said equipment from the FCC (or appropriate national licensing body). Therefore, you would have to

show the dealer a ham ticket in order to buy a linear.
In summary, there is a place for both ham radio and CB, although I'd like to see CB cleaned up. I also oppose any expansion of the current CB band unless it can be demonstrated that there is a clear need for more than 40 channels. Any expansion should take the form of moving the ENTIRE CB band to a UHF TV channel, even though this means the existing equipment is obsolete. The permanent gain would offset the temporary inconvenience.
I'd also like to see the use of AM terminated on CB -- SSB would provide 80 channels in the current frequency assignments, and relieve any congestion.
These are strictly my personal opinions, and not those of my employer.
Regards,
Bill Mitchell, WB2IAU ({ihnp4!}lcuxc!wjm}

++
Fate of the Uniden CR-2021

From Monitoring Times, Dec. 84

"Uniden CR-2021 Fades Into History

Unquestionably, the Uniden CR2021 at its closeout price of under $100 was one of the greatest values ever made available to SWLs. Unfortunately, the stock is now depleted and only the Radio Shack DX400 (at $299) will continue to be made by Uniden. No replacement is expected."

For those of you who still want to try to find one--here's the suppliers who have advertised in Popular Communications [Dec. 84] and Monitoring Times [Dec. 84].

Electronic Equipment Bank, 516 Mill Street, N.E., Vienna, Va. 22180
800 368-3270   and 703 938-3350   ($99 in Pop Comm, $149 in Mon Times)

Universal Shortwave Radio 1280 Aida Drive Reynoldsburg, Ohio 43068
614 866-4267   (listed in their catalog at $129, I believe)

Galaxy Electronics, Box 1202, 67 Eber Ave., Akron, Ohio 44309
216 376-2402   ($124.50)

Presumably Grove Enterprises is out of them--since they publish
Monitoring Times and as posted to the net, Missouri Radio Center
and National Tower appear to be out of them also.

My suggestion for the next best deals in that price range would
be the Sony 6500W, currently being closed out by Spectronics,
1009 Garfield Street, Oak Park, Il 60304 312 848-6777
($96.50 down from a list of $179.95)

That bearcat scanner that can be hooked to an rs-232 port runs up
to the 800 mhz bands. (I don't remember the model number, but get
yerself a copy of "Consumer Electronics" catalog.....they have it
in there).

I think the CommCenter has gone down hill recently. They don't have

any radio gear in the Store anymore and I don't know if they still keep
the mail order business alive. They are too busy selling Apples.

> THOMAS A. BOZA
> WB7ASR
>
> HAM RADIO COMPAIRED TO CITIZEN BAND RADIO
>
>   THERE ARE TWO TYPES OF HOBBYIST SHORTWAVE COMMUNICATIONS RADIO OPERATORS,
> CITIZEN BAND AND AMATEUR "HAM."

     gut reaction: Ouch!

> RADIO STATIONS CAN BE
> OPERATED FROM MANY LOCATIONS, INCLUDING HOME, CAR, BOAT, AIR-PLANE, ETC., BUT
> THEY ARE USED SOLELY FOR PERSONAL SATISFACTION, NOT FOR COMMERCIAL PURPOSES.

     CB can and is used for business purposes.

>   FIRST OF ALL, LET'S CONSIDER CITIZEN BAND OPERATERS.   PEOPLE WHO ARE
> CITIZENS OF THE UNITED STATES OF AMERICIA CAN APPLY AND HOLD A LICENSE. ALL
> THEY HAVE TO DO IS JUST FILL OUT AN APPLICATION AND SEND IT TO THE FEDERAL
> COMMUNICATIONS COMMISSION. SEVERAL WEEKS LATER THEY HAVE THEIR LICENSE AND
> CALL SIGN. NEXT, THEY GO TO THE LOCAL RADIO SHACK OUTLET STORE AND PURCHASE
> A TWO-WAY RADIO WITH ANTENNA; THEN AWAY THEY GO.

     The FCC never licensed CB operators, only CB stations.
     A recent rule change eliminated CB station licenses completely.

> IT'S SO CONGESTED, YOU CAN'T EVEN TALK OVER ONE MILE AWAY.   ONE REASON FOR

> THIS IS THAT THERE ARE OVER FOURTY MILLION CITIZEN BAND LICENSES ISSUED, AS
> WELL AS ALL THE UNLICENSED OPERATORS.

     Again, there is/was no such thing as a "licenced CB operator",
     but there were "licensed CB stations."

>   HE [hams] CAN OPERATE AM, SSB, FM, FAST
> AND SLOW SCAN TELEVISION, SATELLITES, RADIOTELETYPE, FACSIMILE, AND COMPUTERS
> WITH OTHER HAM OPERATORS ALL OVER THE WORLD.

     Hams can use other modes, like morse code and pulse, transmit signals
     for the purpose of remote control (e.g. model aircraft, home control
     systems [home-made garage door openers], etc.), and construct
     repeaters.

>   MOST HAM RADIO OPERATORS BUILD THEIR OWN EQUIPMENT OR RESURRECT OLD
> SURPLUS JUNK.

     Not true any more; most hams purchase their equipment, although
     a few build receivers and transmitters.

                    73 de AJ9S

Sounds like the Compuscan 1200, which was discontinued by Bearcat
when they were bought by Uniden. This radio covered up to 512 MHz, not
800 MHz, as the receiver circuit board was the same one used in
the Bearcat 350 (discontinued) and Bearcat 300.

Several years ago, Bearcat introduced a crystal controlled scanner
that covered 800 MHz (the only scanner to cover this range) but it flopped
and was withdrawn.

to all radio amateurs bt

the following is a list of ten meter beacon stations that were active as of november 1984:

frequency	call	location

28202	zb2vhf	natal s. africa
28205	dl0igi	s. germany
28210	3b8ms	mauritius
28212	zd9gi	gough island
28215	gb3sx	england
28220	5b4cy	cyprus
28222	hg2bha	hungary
28227	zl2mhf	new zealand
28230	bbc	(harmonic)
28233	vp9ba	bermuda
28237	la5ten	oslo, norway
28245	a92c	bahrain island
28247	zs1ctb	s. africa
28250	z21anb	zimbabwe
28254	lu1ug	la pampa, argentina
28257	dk0te	germany
28259	vk5wi	adelaide, australia
28261	vk2rsy	nsw, australia
28262	tu2abj	ivory coast
28263	tr8dx	libreville, gabon
28264	vk6rwa	perth, australia
28269	zs6pw	pretoria, s. africa
28270	vk4rtl	townsville, queensland
28273	9l1ftn	sierra leone
28277	df0aab	germany
28283	vp8ade	british antarctic
28290	vs6ten	hong kong
28295	w3vd	laurel, md
28298	py2ami	sao paulo, brazil
28300	zs1stb	s. africa

others heard on occasion are ea3vhf, ea6au, ea7aml, dj6vq, lu2ffv, lu4fm, lu4hh, lu8eb, oa4ck, ve2ten, ve3ten, vy5ayv, zs3hl, and zs6dn.
the ones listed by frequency are believed to be operating continuously. ar

qst de k9eui
hr dx bulletin nr 44 from arrl headquarters
newington ct november 30, 1984
to all radio amateurs bt

american samoa. nh6j/nh8 made over 3000 contacts in the cq ww contest. he is now qrt. his qsls go to je1jkl. he has left a 160 meter antenna with ah8a, who plans future 160 meter operation.

fernando de noronha. py0fj has been actpve on 7005 khz at 0330z. he is also in a net on 3787 khz ssb, and works 80 meter cw. qsl to py2ajk. py0fk has also been active.

crete. w0pu/sv9 is back in crete anb plans to have all his antennas up by the end of the week. he has been active around 0200 to 0300z on 3503 and 7004 khz. qsl via wb4tdb.

mongolia. jt0ape has been active on 3502 khz at 0000z, workable from europe.

prince patrick island. look for ve8mc around 14190 khz.

franz josef land. rz1owa has been active on 40 meter cw at 1200z with good short path openings from the u.s.

tanzania. 5h3bh will be active on all bands for one more week. qsl to sm0djz.

malagasy republic. 5r8al still does not have permission for 80 meter operation because the band is allocated to the military. he has been on 40 meter ssb regularly at his sunrise on saturday.

propagation. 20 meters has been superb to japan from north america over the north pole just at local sunset in north america.

madeira. ct3bz will be active through this weekend. qsl to sm0gmg.

malawi. 7q7lw has been worked on 7007 khz at 0400z ar

qst de k9eui
hr propagation forecast bulletin nr 49 from arrl headquarters
newington ct december 3, 1984
to all radio amateurs bt

the gradual solar flux rise reported last week continued through november 26. its peak value, 86, the highest since early september, came a bit late in the autumn season to be of benefit, but it brought a welcome improvement in dx conditions on 21 and 28 mhz. two major active areas of the sun responsible for this new lease on life have moved around the west limb now, dropping the solar flux to 79. another area is due back this week, so a large decline is imminent.

it is unlikely that the solar flux will reach levels used for propagation charts appearing in qst for november and december, so look for maximum useable frequencies and duration of dx openings somewhat lower than predicted.

only moderate peaks of geomagnetic activity are expected until december 12, so propagation should be fair to good until then. of special interest to users of 28, 50 and 144 mhz is the annual gemenids meteor shower peaking december 10 through 14. short term ionization produced by these meteors burning up (garble) but large peaks in signal levels on these bands, at distances up to about 1200 miles.

american sunspot numbers for november 22 through 28 were between 17 and 43 for a mean of 31.1 ar

qst de k9eui
hr arrl bulletin nr 108 from arrl headquarters
newington ct november 29, 1984
to all radio amateurs bt

the city of newport news, virginia, has filed comments with fcc in support of prb 1, the leagues request for preemptive relief from local antenna zoning ordinances. the city cites the emergency communication support it has received from amateurs and states that while the city can control its own local zoning, it has no control over other jurisdictions with which its radio operators might have to communicate in an emergency situation. the city concludes by asking the commission to issue a declaratory ruling prohibiting state and local restrictions on federally licensed radio facilities, except where clearly necessary to protect the health and safety of the local citizenry ar

qst de k9eui
hr arrl bulletin nr 110 from arrl headquarters
newington ct november 29, 1984
to all radio amateurs bt

the arrl has filed two petitions for rule making with fcc. the first petition asks the commission to authorize the use of f2 emissions on the 10 meter band from 29.5 to 29.7 mhz to allow 10 meter repeaters to identify using that mode. the second petition asks fcc to amend part 97 of the rules to allow amateur satellite operation on the frequencies allocated at warc 79 for that service. no rm numbers have been assigned to the petitions yet. details will be reported in the arrl letter and qst ar

KEYS:/VADGC DIGIPEATER INFO/
TO: (Group 95)

Last week I put out the announcement that we (AJ9X,W3GXT and I) believe that we know have the magic Cap'n Midnite Decoder Ring that makes bullet-proof digipeaters out of VADG TNC's. I have confirmed that AJ9X would be willing to supply the code on 8" SSSD CP/M disks for assembly with MAC.
Also, we have located a small stash (about 10) VADG bare boards (they were on consignment to Steve, W2FPY). This weekend, we took possesion of what we believe to be the last remaining stock on the east coast (including documentation). The cost is $25 (which has to find its way to Steve since he bought them out of his own pocket!) plus shipping. The person to contact is:
Mike Bruski, AJ9X
5488 Wild Lilac
Columbia, MD 21045
If you want Mike to clone the software, send a diskette and a postage contribution to the same address. I'm hoping that we will get W3GXT to write up his nifty watchdog timer and W3IWI will provide a hint on using 2716's as fast pseudo 2708's.
Tom

KEYS:/EASTNET (MD-DC-VA-NJ-PA DIVISION) NEWS/

EASTNET News de W3IWI
Thought you all might be interested in recent activities from the MD-DC-VA-NJ-PA part of the East Coast packet radio network (a.k.a. EASTNET).
On Sunday, Nov. 25 about a dozen active packeteers from MD (Balto/Wash), southern NJ (Camden/Phila) and south-eastern PA (Harrisburg) met at a rest stop on Interstate 95 near the MD/DE border

(approximately equidistant from the three centers) for the purpose of coordinating EASTNET activities.

One of the major topics was a discussion of the various digipeaters we now have available. The critical "hub" of communications for inter-center communications is the WB4APR-6 digipeater located at Elk Neck, MD (at the head of Chesapeake Bay). This remote system has been a bit ill for the past few weeks (it's receiver was about 7 kHz high) but it is now back in full action following a freq-tweak party.

Reports were given on local digipeaters on the EASTNET 145.01 frequency in the 3 areas. W2FPY-7 is now operational from Hopewell, NJ to serve as a relay northward in NJ. A Camden,NJ location has been picked to serve the Philly area better. In Harrisburg PA, WA3KXG is now operational. In the Balto/Wash area, WB4JFI-5 (primarily for DC area) and W3VD-5 (near Columbia MD) are operational. W3GXT-5 is on experimentally in NE Balto. and K3JYD has plans for a southern MD digipeater that could link to Richmond.

The next topic of discussion concerned packet bulletin board systems (PBBS). WB2MNF (SNJ/Philly) and W3IWI (Balto/Wash) are running the latest W0RLI Xerox 820 PBBS software with automatic inter-BBS linking. In the Balto/Wash area, KS3Q provides backup to the W3IWI PBBS. WB4APR-5 serves as a gateway to 10 MHz, and occasionally W3IWI provides a TelePort gateway thru the AO-10 satellite. After sorting out PBBS user lists, considerable discussion ensued on efficient use of this linking capability.

It is becoming very obvious that 145.01 is becoming clogged in the major metropolitan areas. We decided to recommend that users QSY to 145.03 or 145.05 whenever they have simplex paths available. It was also decided that the PBBS's should continue to operate on the 145.01 "prime" frequency until such time as the PBBS software supports QSY on request.
